RISK CONTROL METHOD, DEVICE, AND STORAGE MEDIUM

ABSTRACT

Embodiments of this specification provide a risk control method, a device, and a storage medium. In the method, when detecting that a target account triggers or is about to trigger a target event, an electronic device obtains user behavior data corresponding to the target account; determines, based on the user behavior data, a probability that the target account is a stolen account; and then determines a risk identification result of the target event based on the probability, where the user behavior data represents a sequence of behaviors performed by a current user of the target account through an interaction page in a historical time period before the target event is initiated.
