Abstract

Provided are a transaction delegation method, a transaction delegation system, and a computer readable medium storing a computer program. In this transaction delegation method: a second device that stores account data in a blockchain system receives, ~~by~~ through communication outside the blockchain system, delegation data from a first device used by a user, ~~said~~ the delegation data being for delegating ~~the~~ execution of a desired transaction of the user in the blockchain system; a delegation transaction that causes an execution smart contract executing a transaction based on an account of the user~~the desired transaction to be executed by an execution smart contract executed from the user's account~~ in the blockchain system to execute the desired transaction is created on the basis of the delegation data transmitted from the first device; and the delegation transaction ~~accompanying the~~with payment of a fee token or a utility token ~~needed to~~required for ~~execute~~ executing a transaction is broadcast to the blockchain system on the basis of the account data.
