ABSTRACT OF THE DISCLOSURE

In a driving apparatus in a sewing machine in which a motor lever 61 is operated so that a clutch plate 61 integral with a motor shaft 58 is pushed against a flywheel 55 integral with the rotor 52 of a main motor or a rotary member 65 which is rotatable around the motor shaft and to which the rotation of an auxiliary motor 75 is applied, whereby the rotation of a motor pulley 59 fixedly mounted on the outer end portion of the motor shaft 58 is transmitted through an endless belt to the spindle of the sewing machine; an auxiliary brake device 81 is provided which directly brakes the rotary member 65 to stop it.
