Abstract

A Method for Enabling Access to a Network

There is provided a method for enabling access to Internet. The method includes providing an electronic device adapted for enabling connection to a network; detecting at least one network on the electronic device; sending a request to connect the electronic device to a selected network; and enabling access to the Internet if the electronic device is connected to the network on a prior occasion when information to enable connection to the selected network was sent to the selected network. Correspondingly, if the electronic device is not connected to the selected network on a prior occasion, the information to enable connection to the selected network is sent to the selected network.
