ABSTRACT

A communication device (100) for an action force for communicating with a control center (200) during a simulation of a security task is provided. The communication device (100) includes a mobile radio device (110) with a transceiver unit (120) for providing at least two separate, independent communication connections (K1, K2) to the control center (200) and a modem (130) for coupling at least one detector (300) for detecting at least one simulation information (SI) relating to the simulation with the mobile radio device (110).
