CLAIMS:

1. A system for providing a la carte reproduction services, comprising:

a reproduction system;

said reproduction system including a printing system, said printing system being capable of performing multiple operational printing modes;

said printing system being configured, in a normal operational printing state, to perform a subset of the multiple operational printing modes; and

a printer service provider server operatively connected to said printing system;

said printing system including a user interface to enable a user to select an operational printing mode;

said printing system, in response to a user selecting an operational printing mode not included in subset of the multiple operational printing modes, communicating with said printer service provider server to request authorization to perform the user selected operational printing mode;

said printer service provider server requesting predetermined information from said printing system;

said printer service provider server, upon processing and verification of information received from said printing system, configuring said printing system to perform the selected operational printing mode.

2. The system as claimed in claim 1, wherein said printing system is configured to perform the subset of the multiple operational printing modes when said printing system first communicates with said printer service provider server, said configuration being based upon a predetermined relationship between said printing system and the printer service provider associated with said printer service provider server.

3. The system as claimed in claim 1, wherein said printing system is configured to perform the subset of the multiple operational printing modes when said printing system is manufactured.

4. The system as claimed in claim 1, wherein a first one of the multiple operational printing modes is black and white printing and a second one of the multiple operational printing modes is color printing;

said printing system being configured to perform black and white printing in the normal operational state and not to perform color printing in the normal operational state.

5. The system as claimed in claim 1, wherein a first one of the multiple operational printing modes is low resolution printing and a second one of the multiple operational printing modes is high resolution printing;

said printing system being configured to perform low resolution printing in the normal operational state and not to perform high resolution printing in the normal operational state.

6. The system as claimed in claim 1, wherein a first one of the multiple operational printing modes is draft quality printing and a second one of the multiple operational printing modes is high quality printing;

said printing system being configured to perform draft quality printing in the normal operational state and not to perform is high quality printing in the normal operational state.

7. The system as claimed in claim 1, wherein said remote reproduction system includes a scanning system, said scanning system being capable of performing multiple operational scanning modes, said scanning system being configured, in a normal operational printing state, to perform a subset of the multiple operational scanning modes.

8. The system as claimed in claim 7, wherein a first one of the multiple operational scanning modes is black and white scanning and a second one of the multiple operational scanning modes is color scanning;

said scanning system being configured to perform black and white scanning in the normal operational state and not to perform is color scanning in the normal operational state.

9. The system as claimed in claim 7, wherein a first one of the multiple operational scanning modes is low resolution scanning and a second one of the multiple operational scanning modes is high resolution scanning;

said scanning system being configured to perform low resolution scanning in the normal operational state and not to perform is high resolution scanning in the normal operational state.

10. The system as claimed in claim 7, wherein a third one of the multiple operational scanning modes is optical character recognition;

said scanning system being configured not to perform optical character recognition in the normal operational state.

11. The system as claimed in claim 7, wherein a third one of the multiple operational scanning modes is scan to multiple destinations;

said scanning system being configured not to perform scan to multiple destinations in the normal operational state.

12. The system as claimed in claim 7, wherein said remote reproduction system is configured to prevent copying in the normal operational state and a selectable operational mode is copying enabled.

13. The system as claimed in claim 1, wherein said remote reproduction system is configured to prevent job-based accounting in the normal operational state and a selectable operational mode is job-based accounting enabled.

14. The system as claimed in claim 1, wherein the predetermined information includes payment information from the user.

15. The system as claimed in claim 1, wherein the predetermined information includes information authenticating the user.

16. The system as claimed in claim 1, wherein the predetermined information includes information authenticating said printing system.

17. The system as claimed in claim 1, wherein said printer service provider server is operatively connected to said printing system through said reproduction system.

18. A method for providing a la carte reproduction services, comprising:

providing a reproduction system, the reproduction system including a printing system, the printing system being capable of performing multiple operational printing modes;

configuring the printing system, in a normal operational printing state, to perform a subset of the multiple operational printing modes;

providing a printer service provider server operatively connected to the printing system;

enabling a user to select an operational printing mode through a user interface associated with the printing system;

the printing system communicating, in response to a user selecting an operational printing mode not included in subset of the multiple operational printing modes, with the printer service provider server to request authorization to perform the user selected operational printing mode;

the printer service provider server requesting predetermined information from the printing system;

the printer service provider server configuring, upon processing and verification of information received from said printing system, the printing system to perform the selected operational printing mode.

19. The method as claimed in claim 18, wherein the printing system is configured to perform the subset of the multiple operational printing modes when the printing system first communicates with the printer service provider server, the configuration being based upon a predetermined relationship between the printing system and the printer service provider associated with the printer service provider server.

20. The method as claimed in claim 18, wherein the printing system is configured to perform the subset of the multiple operational printing modes when the printing system is manufactured.

21. The method as claimed in claim 18, wherein a first one of the multiple operational printing modes is black and white printing and a second one of the multiple operational printing modes is color printing;

the printing system being configured to perform black and white printing in the normal operational state and not to perform color printing in the normal operational state.

22. The method as claimed in claim 18, wherein a first one of the multiple operational printing modes is low resolution printing and a second one of the multiple operational printing modes is high resolution printing;

the printing system being configured to perform low resolution printing in the normal operational state and not to perform high resolution printing in the normal operational state.

23. The method as claimed in claim 18, wherein a first one of the multiple operational printing modes is draft quality printing and a second one of the multiple operational printing modes is high quality printing;

the printing system being configured to perform draft quality printing in the normal operational state and not to perform is high quality printing in the normal operational state.

24. The method as claimed in claim 18, wherein the remote reproduction system includes a scanning system, the scanning system being capable of performing multiple operational scanning modes, the scanning system being configured, in a normal operational printing state, to perform a subset of the multiple operational scanning modes.

25. The method as claimed in claim 24, wherein a first one of the multiple operational scanning modes is black and white scanning and a second one of the multiple operational scanning modes is color scanning;

said scanning system being configured to perform black and white scanning in the normal operational state and not to perform is color scanning in the normal operational state.

26. The method as claimed in claim 24, wherein a first one of the multiple operational scanning modes is low resolution scanning and a second one of the multiple operational scanning modes is high resolution scanning;

the scanning system being configured to perform low resolution scanning in the normal operational state and not to perform is high resolution scanning in the normal operational state.

27. The method as claimed in claim 24, wherein a third one of the multiple operational scanning modes is optical character recognition;

the scanning system being configured not to perform optical character recognition in the normal operational state.

28. The method as claimed in claim 24, wherein a third one of the multiple operational scanning modes is scan to multiple destinations;

the scanning system being configured not to perform scan to multiple destinations in the normal operational state.

29. The method as claimed in claim 24, wherein the remote reproduction system is configured to prevent copying in the normal operational state and a selectable operational mode is copying enabled.

30. The method as claimed in claim 18, wherein the remote reproduction system is configured to prevent job-based accounting in the normal operational state and a selectable operational mode is job-based accounting enabled.

31. The method as claimed in claim 18, wherein the predetermined information includes payment information from the user.

32. The method as claimed in claim 18, wherein the predetermined information includes information authenticating the user.

33. The method as claimed in claim 18, wherein the predetermined information includes information authenticating the printing system.

34. The method as claimed in claim 18, wherein the printer service provider server is operatively connected to the printing system through the reproduction system.

35. A system for providing printing services to mobile devices, comprising:

a mobile device;

a remote print service provider server operatively connected to said mobile device; and

local printers operatively connected to said remote print service provider server;

said mobile device transmitting a print request to said remote print service provider server;

said remote print service provider server determining a physical location of said mobile device;

said remote print service provider server determining which local printers are located within a predetermined parameter of the physical location of said mobile device and determining which of the determined physically local printers are capable of executing the print request from said mobile device;

said remote print service provider server transmitting information to said mobile device identifying local printers capable of executing the print request and physical locations of the local printers with respect to the physical location of said mobile device.

36. The system as claimed in claim 35, wherein said mobile device selects a local printer identified by said remote print service provider server;

said remote print service provider server transmitting the print request to the selected local printer, the selected local printer processing the print request.

37. The system as claimed in claim 35, wherein said remote print service provider server includes print drivers for all the local printers and processes the print request utilizing the print driver of the selected local printer prior to transmitting the print request to the selected local printer.

38. The system as claimed in claim 35, wherein the information transmitted by said remote print service provider server includes pricing information for each identified local printer.

39. The system as claimed in claim 35, wherein the local printers are owned by third parties.

40. The system as claimed in claim 35, wherein said remote print service provider server determines which of the determined physically local printers are capable of executing a substitute print request corresponding to the print request from said mobile device.

41. The system as claimed in claim 40, wherein the print request corresponds to color printing and substitute print request corresponds to black and white printing.

42. The system as claimed in claim 35, wherein said mobile device includes a global-positioning satellite tracking system, the global-positioning satellite tracking system providing information to said remote print service provider server identifying a physical location of said mobile device.

43. The system as claimed in claim 35, wherein said remote print service provider server providing map information corresponding to the local printers which are located within the predetermined parameter of the physical location of said mobile device.

44. The system as claimed in claim 35, further comprising:

local reproduction systems, each local reproduction system including a scanning device and a printing device;

said mobile device transmitting a scanning request to said remote print service provider server;

said remote print service provider server determining a physical location of said mobile device;

said remote print service provider server determining which local reproduction systems are located within a predetermined parameter of the physical location of said mobile device and determining which of the determined physically local reproduction systems are capable of executing the scanning request from said mobile device;

said remote print service provider server transmitting information to said mobile device identifying local reproduction systems capable of executing the scanning request and physical locations of the local reproduction systems with respect to the physical location of said mobile device.

45. The system as claimed in claim 35, further comprising:

local scanning devices;

said mobile device transmitting a scanning request to said remote print service provider server;

said remote print service provider server determining a physical location of said mobile device;

said remote print service provider server determining which local scanning devices are located within a predetermined parameter of the physical location of said mobile device and determining which of the determined physically local scanning devices are capable of executing the scanning request from said mobile device;

said remote print service provider server transmitting information to said mobile device identifying local scanning devices capable of executing the scanning request and physical locations of the local scanning devices with respect to the physical location of said mobile device.

46. The system as claimed in claim 35, further comprising:

local reproduction systems, each local reproduction system including a scanning device and a printing device;

said mobile device transmitting a copying request to said remote print service provider server;

said remote print service provider server determining a physical location of said mobile device;

said remote print service provider server determining which local reproduction systems are located within a predetermined parameter of the physical location of said mobile device and determining which of the determined physically local reproduction systems are capable of executing the copying request from said mobile device;

said remote print service provider server transmitting information to said mobile device identifying local reproduction systems capable of executing the copying request and physical locations of the local reproduction systems with respect to the physical location of said mobile device.

47. The system as claimed in claim 35, further comprising:

local reproduction systems, each local reproduction system including a scanning device and a printing device;

said mobile device transmitting a fax request to said remote print service provider server;

said remote print service provider server determining a physical location of said mobile device;

said remote print service provider server determining which local reproduction systems are located within a predetermined parameter of the physical location of said mobile device and determining which of the determined physically local reproduction systems are capable of executing the fax request from said mobile device;

said remote print service provider server transmitting information to said mobile device identifying local reproduction systems capable of executing the fax request and physical locations of the local reproduction systems with respect to the physical location of said mobile device.

48. The system as claimed in claim 35, further comprising:

local fax devices;

said mobile device transmitting a fax request to said remote print service provider server;

said remote print service provider server determining a physical location of said mobile device;

said remote print service provider server determining which local fax devices are located within a predetermined parameter of the physical location of said mobile device and determining which of the determined physically local fax devices are capable of executing the fax request from said mobile device;

said remote print service provider server transmitting information to said mobile device identifying local fax devices capable of executing the fax request and physical locations of the local fax devices with respect to the physical location of said mobile device.

49. A system for providing printing services to mobile devices, comprising:

a mobile device;

a remote print service provider server operatively connected to said mobile device; and

local printers operatively connected to said remote print service provider server;

said mobile device transmitting a printer location request to said remote print service provider server;

said remote print service provider server determining a physical location of said mobile device;

said remote print service provider server determining which local printers are located within a predetermined parameter of the physical location of said mobile device;

said remote print service provider server transmitting information to said mobile device identifying physical locations of local printers with respect to the physical location of said mobile device;

said mobile device selecting a local printer identified by said remote print service provider server and transmitting, to said remote print service provider server, a print request, the print request including identification information corresponding to the selected local printer;

said remote print service provider server transmitting the print request to the selected local printer, the selected local printer processing the print request.

50. The system as claimed in claim 49, wherein said remote print service provider server includes print drivers for all the local printers and processes the print request utilizing the print driver of the selected local printer prior to transmitting the print request to the selected local printer.

51. The system as claimed in claim 49, wherein the information transmitted by said remote print service provider server includes pricing information for each identified local printer.

52. The system as claimed in claim 49, wherein the local printers are owned by third parties.

53. The system as claimed in claim 49, wherein said mobile device includes a global-positioning satellite tracking system, the global-positioning satellite tracking system providing information to said remote print service provider server identifying a physical location of said mobile device.

54. The system as claimed in claim 49, wherein said remote print service provider server providing map information corresponding to the local printers which are located within the predetermined parameter of the physical location of said mobile device.

55. The system as claimed in claim 49, further comprising:

local reproduction systems, each local reproduction system including a scanning device and a printing device;

said mobile device transmitting a scanning request to said remote print service provider server;

said remote print service provider server determining a physical location of said mobile device;

said remote print service provider server determining which local reproduction systems are located within a predetermined parameter of the physical location of said mobile device and determining which of the determined physically local reproduction systems are capable of executing the scanning request from said mobile device;

said remote print service provider server transmitting information to said mobile device identifying local reproduction systems capable of executing the scanning request and physical locations of the local reproduction systems with respect to the physical location of said mobile device.

56. The system as claimed in claim 49, further comprising:

local scanning devices;

said mobile device transmitting a scanning request to said remote print service provider server;

said remote print service provider server determining a physical location of said mobile device;

said remote print service provider server determining which local scanning devices are located within a predetermined parameter of the physical location of said mobile device and determining which of the determined physically local scanning devices are capable of executing the scanning request from said mobile device;

said remote print service provider server transmitting information to said mobile device identifying local scanning devices capable of executing the scanning request and physical locations of the local scanning devices with respect to the physical location of said mobile device.

57. The system as claimed in claim 49, further comprising:

local reproduction systems, each local reproduction system including a scanning device and a printing device;

said mobile device transmitting a copying request to said remote print service provider server;

said remote print service provider server determining a physical location of said mobile device;

said remote print service provider server determining which local reproduction systems are located within a predetermined parameter of the physical location of said mobile device and determining which of the determined physically local reproduction systems are capable of executing the copying request from said mobile device;

said remote print service provider server transmitting information to said mobile device identifying local reproduction systems capable of executing the copying request and physical locations of the local reproduction systems with respect to the physical location of said mobile device.

58. The system as claimed in claim 49, further comprising:

local reproduction systems, each local reproduction system including a scanning device and a printing device;

said mobile device transmitting a fax request to said remote print service provider server;

said remote print service provider server determining a physical location of said mobile device;

said remote print service provider server determining which local reproduction systems are located within a predetermined parameter of the physical location of said mobile device and determining which of the determined physically local reproduction systems are capable of executing the fax request from said mobile device;

said remote print service provider server transmitting information to said mobile device identifying local reproduction systems capable of executing the fax request and physical locations of the local reproduction systems with respect to the physical location of said mobile device.

59. The system as claimed in claim 49, further comprising:

local fax devices;

said mobile device transmitting a fax request to said remote print service provider server;

said remote print service provider server determining a physical location of said mobile device;

said remote print service provider server determining which local fax devices are located within a predetermined parameter of the physical location of said mobile device and determining which of the determined physically local fax devices are capable of executing the fax request from said mobile device;

said remote print service provider server transmitting information to said mobile device identifying local fax devices capable of executing the fax request and physical locations of the local fax devices with respect to the physical location of said mobile device.

60. A method for providing printing services to a mobile device connected to a network, comprising:

providing a remote print service provider server operatively connected to the mobile device;

providing local printers operatively connected to the remote print service provider server;

transmitting, from the mobile device, a print request to the remote print service provider server;

the remote print service provider server determining a physical location of the mobile device;

the remote print service provider server determining which local printers are located within a predetermined parameter of the physical location of the mobile device and determining which of the determined physically local printers are capable of executing the print request from the mobile device; and

the remote print service provider server transmitting information to the mobile device identifying local printers capable of executing the print request and physical locations of local printers with respect to the physical location of the mobile device.

61. The method as claimed in claim 60, wherein the mobile device selects a local printer identified by the remote print service provider server;

the remote print service provider server transmitting the print request to the selected local printer, the selected local printer processing the print request.

62. The method as claimed in claim 60, wherein the remote print service provider server includes print drivers for all the local printers and processes the print request utilizing the print driver of the selected local printer prior to transmitting the print request to the selected local printer.

63. The method as claimed in claim 60, wherein the information transmitted by the remote print service provider server includes pricing information for each identified local printer.

64. The method as claimed in claim 160, wherein the local printers are owned by third parties.

65. The method as claimed in claim 60, wherein the remote print service provider server determines which of the determined physically local printers are capable of executing a substitute print request corresponding to the print request from said mobile device.

66. The method as claimed in claim 65, wherein the print request corresponds to color printing and substitute print request corresponds to black and white printing.

67. The method as claimed in claim 60, wherein the mobile device includes a global-positioning satellite tracking system, the global-positioning satellite tracking system providing information to the remote print service provider server identifying a physical location of the mobile device.

68. The method as claimed in claim 60, wherein the remote print service provider server providing map information corresponding to the local printers which are located within the predetermined parameter of the physical location of the mobile device.

69. The method as claimed in claim 60, further comprising:

providing local reproduction systems, each local reproduction system including a scanning device and a printing device;

the mobile device transmitting a scanning request to the remote print service provider server;

the remote print service provider server determining a physical location of said mobile device;

the remote print service provider server determining which local reproduction systems are located within a predetermined parameter of the physical location of said mobile device and determining which of the determined physically local reproduction systems are capable of executing the scanning request from the mobile device;

the remote print service provider server transmitting information to the mobile device identifying local reproduction systems capable of executing the scanning request and physical locations of the local reproduction systems with respect to the physical location of the mobile device.

70. The method as claimed in claim 60, further comprising:

providing local scanning devices;

the mobile device transmitting a scanning request to the remote print service provider server;

the remote print service provider server determining a physical location of the mobile device;

the remote print service provider server determining which local scanning devices are located within a predetermined parameter of the physical location of the mobile device and determining which of the determined physically local scanning devices are capable of executing the scanning request from the mobile device;

the remote print service provider server transmitting information to the mobile device identifying local scanning devices capable of executing the scanning request and physical locations of the local scanning devices with respect to the physical location of the mobile device.

71. The method as claimed in claim 60, further comprising:

providing local reproduction systems, each local reproduction system including a scanning device and a printing device;

the mobile device transmitting a copying request to the remote print service provider server;

the remote print service provider server determining a physical location of the mobile device;

the remote print service provider server determining which local reproduction systems are located within a predetermined parameter of the physical location of the mobile device and determining which of the determined physically local reproduction systems are capable of executing the copying request from the mobile device;

the remote print service provider server transmitting information to the mobile device identifying local reproduction systems capable of executing the copying request and physical locations of the local reproduction systems with respect to the physical location of the mobile device.

72. The method as claimed in claim 60, further comprising:

providing local reproduction systems, each local reproduction system including a scanning device and a printing device;

the mobile device transmitting a fax request to the remote print service provider server;

the remote print service provider server determining a physical location of the mobile device;

the remote print service provider server determining which local reproduction systems are located within a predetermined parameter of the physical location of the mobile device and determining which of the determined physically local reproduction systems are capable of executing the fax request from the mobile device;

the remote print service provider server transmitting information to the mobile device identifying local reproduction systems capable of executing the fax request and physical locations of the local reproduction systems with respect to the physical location of the mobile device.

73. The method as claimed in claim 60, further comprising:

providing local fax devices;

the mobile device transmitting a fax request to the remote print service provider server;

the remote print service provider server determining a physical location of the mobile device;

the remote print service provider server determining which local fax devices are located within a predetermined parameter of the physical location of the mobile device and determining which of the determined physically local fax devices are capable of executing the fax request from the mobile device;

the remote print service provider server transmitting information to the mobile device identifying local fax devices capable of executing the fax request and physical locations of the local fax devices with respect to the physical location of the mobile device.

74. A method for providing printing services to a mobile device connected to a network, comprising:

providing a remote print service provider server operatively connected to the mobile device;

providing local printers operatively connected to the remote print service provider server;

the mobile device transmitting a printer location request to the remote print service provider server;

the remote print service provider server determining a physical location of the mobile device;

the remote print service provider server determining which local printers are located within a predetermined parameter of the physical location of the mobile device;

the remote print service provider server transmitting information to the mobile device identifying physical locations of local printers with respect to the physical location of the mobile device;

the mobile device selecting a local printer identified by the remote print service provider server and transmitting, to the remote print service provider server, a print request, the print request including identification information corresponding to the selected local printer; and

the remote print service provider server transmitting the print request to the selected local printer, the selected local printer processing the print request.

75. The method as claimed in claim 74, wherein the remote print service provider server includes print drivers for all the local printers and processes the print request utilizing the print driver of the selected local printer prior to transmitting the print request to the selected local printer.

76. The method as claimed in claim 74, wherein the information transmitted by the remote print service provider server includes pricing information for each identified local printer.

77. The method as claimed in claim 74, wherein the local printers are owned by third parties.

78. The method as claimed in claim 74, wherein the mobile device includes a global-positioning satellite tracking system, the global-positioning satellite tracking system providing information to the remote print service provider server identifying a physical location of the mobile device.

79. The method as claimed in claim 74, wherein the remote print service provider server providing map information corresponding to the local printers which are located within the predetermined parameter of the physical location of the mobile device.

80. The method as claimed in claim 74, further comprising:

providing local reproduction systems, each local reproduction system including a scanning device and a printing device;

the mobile device transmitting a scanning request to the remote print service provider server;

the remote print service provider server determining a physical location of said mobile device;

the remote print service provider server determining which local reproduction systems are located within a predetermined parameter of the physical location of said mobile device and determining which of the determined physically local reproduction systems are capable of executing the scanning request from the mobile device;

the remote print service provider server transmitting information to the mobile device identifying local reproduction systems capable of executing the scanning request and physical locations of the local reproduction systems with respect to the physical location of the mobile device.

81. The method as claimed in claim 74, further comprising:

providing local scanning devices;

the mobile device transmitting a scanning request to the remote print service provider server;

the remote print service provider server determining a physical location of the mobile device;

the remote print service provider server determining which local scanning devices are located within a predetermined parameter of the physical location of the mobile device and determining which of the determined physically local scanning devices are capable of executing the scanning request from the mobile device;

the remote print service provider server transmitting information to the mobile device identifying local scanning devices capable of executing the scanning request and physical locations of the local scanning devices with respect to the physical location of the mobile device.

82. The method as claimed in claim 74, further comprising:

providing local reproduction systems, each local reproduction system including a scanning device and a printing device;

the mobile device transmitting a copying request to the remote print service provider server;

the remote print service provider server determining a physical location of the mobile device;

the remote print service provider server determining which local reproduction systems are located within a predetermined parameter of the physical location of the mobile device and determining which of the determined physically local reproduction systems are capable of executing the copying request from the mobile device;

the remote print service provider server transmitting information to the mobile device identifying local reproduction systems capable of executing the copying request and physical locations of the local reproduction systems with respect to the physical location of the mobile device.

83. The method as claimed in claim 74, further comprising:

providing local reproduction systems, each local reproduction system including a scanning device and a printing device;

the mobile device transmitting a fax request to the remote print service provider server;

the remote print service provider server determining a physical location of the mobile device;

the remote print service provider server determining which local reproduction systems are located within a predetermined parameter of the physical location of the mobile device and determining which of the determined physically local reproduction systems are capable of executing the fax request from the mobile device;

the remote print service provider server transmitting information to the mobile device identifying local reproduction systems capable of executing the fax request and physical locations of the local reproduction systems with respect to the physical location of the mobile device.

84. The method as claimed in claim 74, further comprising:

providing local fax devices;

the mobile device transmitting a fax request to the remote print service provider server;

the remote print service provider server determining a physical location of the mobile device;

the remote print service provider server determining which local fax devices are located within a predetermined parameter of the physical location of the mobile device and determining which of the determined physically local fax devices are capable of executing the fax request from the mobile device;

the remote print service provider server transmitting information to the mobile device identifying local fax devices capable of executing the fax request and physical locations of the local fax devices with respect to the physical location of the mobile device.

85. A method for providing printing services to a mobile device connected to a network, comprising:

providing a remote print service provider server;

providing local printers operatively connected to the remote print service provider server;

each local printer providing the remote print service provider server with information associated with a physical location of the local printer;

each local printer providing the remote print service provider server with information identifying which functions of the local printer are being made available to an end user of the mobile device;

each local printer providing the remote print service provider server with information identifying when the local printer is available to provide the identified functionality to the end user of the mobile device; and

the remote print service provider server creating a network of community local printers which are available for utilization by the end user of the mobile device.

86. The method as claimed in claim 85, further comprising:

each local printer providing the remote print service provider server with information identifying a cost for utilizing the identified functionality.

87. A system for providing printing services to a mobile device connected to a network, comprising:

a remote print service provider server; and

local printers operatively connected to said remote print service provider server;

each local printer providing said remote print service provider server with information associated with a physical location of the local printer;

each local printer providing said remote print service provider server with information identifying which functions of the local printer are being made available to an end user of the mobile device;

each local printer providing said remote print service provider server with information identifying when the local printer is available to provide the identified functionality to the end user of the mobile device;

said remote print service provider server creating a network of community local printers which are available for utilization by the end user of the mobile device.

88. The system as claimed in claim 87, wherein each local printer provides said remote print service provider server with information identifying a cost for utilizing the identified functionality.

CLAIMS:

1. A system for providing a la carte reproduction services, comprising:

a reproduction system;

said reproduction system including a printing system, said printing system being capable of performing multiple operational printing modes;

said printing system being configured, in a normal operational printing state, to perform a user-selectable subset of the multiple operational printing modes that is selected by the user; and

a printer service provider server operatively connected to said printing system;

said printing system including a user interface to enable a user to select an operational printing mode;

said printing system, in response to a user selecting an operational printing mode not included in subset of the multiple operational printing modes, communicating with said printer service provider server to request authorization to perform the user selected operational printing mode;

said printer service provider server requesting predetermined information from said printing system;

said printer service provider server, upon processing and verification of information received from said printing system, configuring said printing system to perform the selected operational printing mode.

2. The system as claimed in claim 1, wherein said printing system is configured to perform the subset of the multiple operational printing modes when said printing system first communicates with said printer service provider server, said configuration being based upon a predetermined relationship between said printing system and the printer service provider associated with said printer service provider server.

3. The system as claimed in claim 1, wherein said printing system is configured to perform the subset of the multiple operational printing modes when said printing system is manufactured.

4. The system as claimed in claim 1, wherein a first one of the multiple operational printing modes is black and white printing and a second one of the multiple operational printing modes is color printing;

said printing system being configured to perform black and white printing in the normal operational state and not to perform color printing in the normal operational state.

5. The system as claimed in claim 1, wherein a first one of the multiple operational printing modes is low resolution printing and a second one of the multiple operational printing modes is high resolution printing;

said printing system being configured to perform low resolution printing in the normal operational state and not to perform high resolution printing in the normal operational state.

6. The system as claimed in claim 1, wherein a first one of the multiple operational printing modes is draft quality printing and a second one of the multiple operational printing modes is high quality printing;

said printing system being configured to perform draft quality printing in the normal operational state and not to perform is high quality printing in the normal operational state.

7. The system as claimed in claim 1, wherein said remote reproduction system includes a scanning system, said scanning system being capable of performing multiple operational scanning modes, said scanning system being configured, in a normal operational printing state, to perform a subset of the multiple operational scanning modes.

8. The system as claimed in claim 7, wherein a first one of the multiple operational scanning modes is black and white scanning and a second one of the multiple operational scanning modes is color scanning;

said scanning system being configured to perform black and white scanning in the normal operational state and not to perform is color scanning in the normal operational state.

9. The system as claimed in claim 7, wherein a first one of the multiple operational scanning modes is low resolution scanning and a second one of the multiple operational scanning modes is high resolution scanning;

said scanning system being configured to perform low resolution scanning in the normal operational state and not to perform is high resolution scanning in the normal operational state.

10. The system as claimed in claim 7, wherein a third one of the multiple operational scanning modes is optical character recognition;

said scanning system being configured not to perform optical character recognition in the normal operational state.

11. The system as claimed in claim 7, wherein a third one of the multiple operational scanning modes is scan to multiple destinations;

said scanning system being configured not to perform scan to multiple destinations in the normal operational state.

12. The system as claimed in claim 7, wherein said remote reproduction system is configured to prevent copying in the normal operational state and a selectable operational mode is copying enabled.

13. The system as claimed in claim 1, wherein said remote reproduction system is configured to prevent job-based accounting in the normal operational state and a selectable operational mode is job-based accounting enabled.

14. The system as claimed in claim 1, wherein the predetermined information includes payment information from the user.

15. The system as claimed in claim 1, wherein the predetermined information includes information authenticating the user.

16. The system as claimed in claim 1, wherein the predetermined information includes information authenticating said printing system.

17. The system as claimed in claim 1, wherein said printer service provider server is operatively connected to said printing system through said reproduction system.

18. A method for providing a la carte reproduction services, comprising:

providing a reproduction system, the reproduction system including a printing system, the printing system being capable of performing multiple operational printing modes;

configuring the printing system, in a normal operational printing state, to perform a user-selectable subset of the multiple operational printing modes that is selected by the user;

providing a printer service provider server operatively connected to the printing system;

enabling a user to select an operational printing mode through a user interface associated with the printing system;

the printing system communicating, in response to a user selecting an operational printing mode not included in subset of the multiple operational printing modes, with the printer service provider server to request authorization to perform the user selected operational printing mode;

the printer service provider server requesting predetermined information from the printing system;

the printer service provider server configuring, upon processing and verification of information received from said printing system, the printing system to perform the selected operational printing mode.

19. The method as claimed in claim 18, wherein the printing system is configured to perform the subset of the multiple operational printing modes when the printing system first communicates with the printer service provider server, the configuration being based upon a predetermined relationship between the printing system and the printer service provider associated with the printer service provider server.

20. The method as claimed in claim 18, wherein the printing system is configured to perform the subset of the multiple operational printing modes when the printing system is manufactured.

21. The method as claimed in claim 18, wherein a first one of the multiple operational printing modes is black and white printing and a second one of the multiple operational printing modes is color printing;

the printing system being configured to perform black and white printing in the normal operational state and not to perform color printing in the normal operational state.

22. The method as claimed in claim 18, wherein a first one of the multiple operational printing modes is low resolution printing and a second one of the multiple operational printing modes is high resolution printing;

the printing system being configured to perform low resolution printing in the normal operational state and not to perform high resolution printing in the normal operational state.

23. The method as claimed in claim 18, wherein a first one of the multiple operational printing modes is draft quality printing and a second one of the multiple operational printing modes is high quality printing;

the printing system being configured to perform draft quality printing in the normal operational state and not to perform is high quality printing in the normal operational state.

24. The method as claimed in claim 18, wherein the remote reproduction system includes a scanning system, the scanning system being capable of performing multiple operational scanning modes, the scanning system being configured, in a normal operational printing state, to perform a subset of the multiple operational scanning modes.

25. The method as claimed in claim 24, wherein a first one of the multiple operational scanning modes is black and white scanning and a second one of the multiple operational scanning modes is color scanning;

said scanning system being configured to perform black and white scanning in the normal operational state and not to perform is color scanning in the normal operational state.

26. The method as claimed in claim 24, wherein a first one of the multiple operational scanning modes is low resolution scanning and a second one of the multiple operational scanning modes is high resolution scanning;

the scanning system being configured to perform low resolution scanning in the normal operational state and not to perform is high resolution scanning in the normal operational state.

27. The method as claimed in claim 24, wherein a third one of the multiple operational scanning modes is optical character recognition;

the scanning system being configured not to perform optical character recognition in the normal operational state.

28. The method as claimed in claim 24, wherein a third one of the multiple operational scanning modes is scan to multiple destinations;

the scanning system being configured not to perform scan to multiple destinations in the normal operational state.

29. The method as claimed in claim 24, wherein the remote reproduction system is configured to prevent copying in the normal operational state and a selectable operational mode is copying enabled.

30. The method as claimed in claim 18, wherein the remote reproduction system is configured to prevent job-based accounting in the normal operational state and a selectable operational mode is job-based accounting enabled.

31. The method as claimed in claim 18, wherein the predetermined information includes payment information from the user.

32. The method as claimed in claim 18, wherein the predetermined information includes information authenticating the user.

33. The method as claimed in claim 18, wherein the predetermined information includes information authenticating the printing system.

34. The method as claimed in claim 18, wherein the printer service provider server is operatively connected to the printing system through the reproduction system.
