HANDLING OF MULTIPLE PICTURE SIZE AND CONFORMANCE WINDOWS FOR REFERENCE PICTURE RESAMPLING IN VIDEO CODING

ABSTRACT

A method of decoding includes receiving a first picture parameter set and a second picture parameter set each referring to the same sequence parameter set, wherein when the first picture parameter set and the second picture parameter set have the same values of picture width and picture height, the first picture parameter set and the second picture parameter set have the same values of a conformance window; and applying the conformance window to a current picture corresponding to the first picture parameter set or the second picture parameter set.
