(54) Title: **TIMER MODULE FOR COMPACT PRINTER SYSTEM**

(57) Abstract: A timer module useful in a digital imaging system such as a compact printer system. The timer module includes a control means that automates the capture of multiple images by a connected camera module. The images are stored in a connected memory module. The capture of each image is separated by a specific time interval. The time interval is selected by a plurality of buttons incorporated in the timing module and feedback may be provided via an LCD. The timer module incorporates two connection means. One or other of the connecting means connects to corresponding connection means on the camera module, the memory module or a printer module. The connection means includes a physical connection and a logical connection. The logical connection is a serial bus that communicates power and data.
