CLAIMS

1. A resin cap to be attached to a container mouth part, the resin cap comprising:

a top plate part;

a tubular part that extends downward from a circumferential edge of the top plate part;

an inner ring that is formed on an inner surface of the top plate part and is capable of coming into contact with an inner circumferential surface of the container mouth part; and

a contact ring that is formed on the inner surface of the top plate part and is capable of coming into contact with a front end part of the container mouth part,

wherein the contact ring is configured to be capable of undergoing displacement due to contact with the front end part of the container mouth part, and

the contact ring is formed in a shape having a narrow part as the center via which a tapered part whose width decreases from the top plate part side toward the front end part of the container mouth part and a reversed tapered part whose width increases toward the front end part of the container mouth part are connected.
