ABSTRACT

Aspects concern a server comprising a processor configured to: obtain information about an order for an on-demand service, including first information about a location relating to the order and second information about time relating to the order; determine whether the order relates to a predetermined area and time, based on whether the location relating to the order relates to a predetermined area and the time relating to the order relates to a predetermined time; if it is determined that the order does not relate to the predetermined area and time, search one or more delivery service providers based on a first search option; if it is determined that the order relates to the predetermined area and time, search the one or more delivery service providers based on a second search option; and allocate the order to a delivery service provider selected from the one or more delivery service providers.
