BINDING IMPLEMENT AND FILE

ABSTRACT

A binding implement and file can bind objects to be bound easily and take out bound objects easily. A binding implement 8 has a binding implement body 6 and binding members 7. The binding member 7 has a first binding member 21 and a second binding member 22. The first and second binding members 21 and 22 have a plate-shaped frame portion 23 having plasticity and an insertion portion 24 connected to the frame portion 23. Each frame portion 23 is turnably connected to the binding implement body 6. The insertion portion 24 is connected to the other insertion portion 24 via a second hinge portion. The binding member 7 can vary between a standing state where each insertion portion 24 is not inserted into the through-holes 17a and 17b, and a fallen state where each insertion portion 24 is inserted into the through-holes 17a and 17b.
