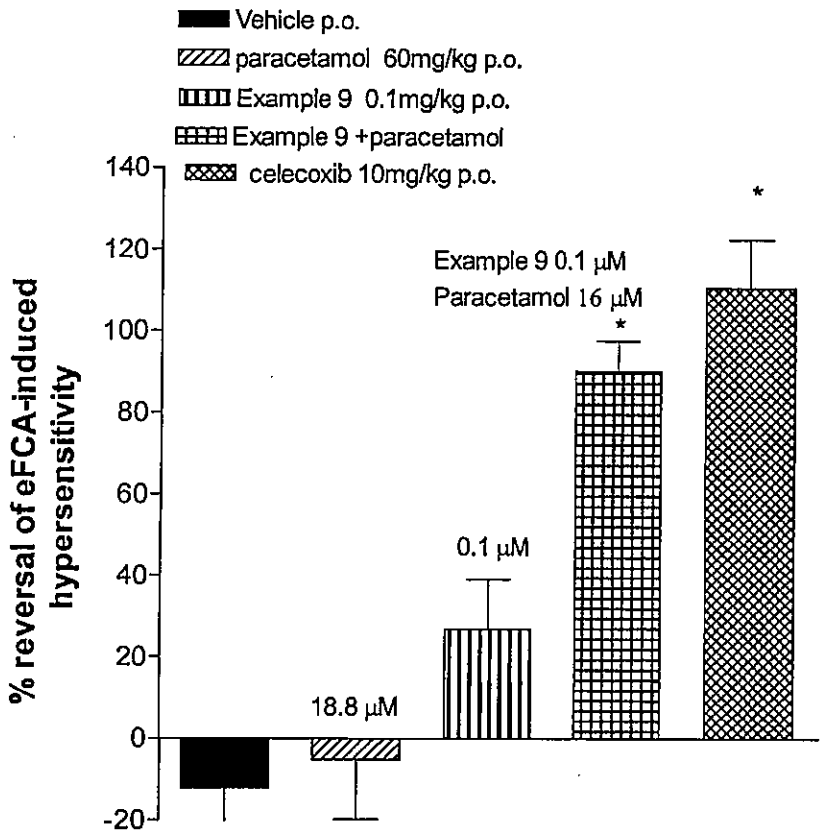
Figure 1 - The effect of combining Example 9 (0.1 mg/kg) and paracetamol (60 mg/kg) alone and in combination on FCA-induced hypersensitivity.



Data are represented as mean ± SEM (n=7 per group), and analysed by ANOVA followed by a Fisher LSD test, where drug treated groups were compared with vehicle, and for the combination group, compared with drug alone treated groups. * indicates $P<0.05$. Terminal blood concentrations quoted.

Figure 2 – Theoretical additive dose response curve vs. actual observed dose response curve for Example 9 + paracetamol combination
