PROCESSING METHOD AND APPARATUS FOR PAYMENT SERVICE, STORAGE MEDIUM, AND COMPUTER SYSTEM

ABSTRACT

Embodiments of this specification provide a processing method for a payment service that involves at least an acquiring institution and a third-party platform in a first region and a wallet serving end in a second region. The method is applied to the third-party platform and includes: first, generating a third-party order number based on a first order placement request received from an upstream platform, where the first order placement request includes information about a target payment service; then, sending a second order placement request to the wallet serving end, and without waiting for return of a corresponding order placement success result, directly sending a target notification indicating the order placement success result to the upstream platform; then, receiving an order number replacement request sent by the wallet serving end based on an interception request received from a wallet app; and then, providing the third-party order number found based on an acquiring order number carried in the order number replacement request to the wallet serving end if the order placement success result is returned, so that the wallet serving end provides cashier interface information to the wallet app based on the third-party order number, to complete a target payment.
