

Summary

The mounting apparatus on a firearm, in accord with the invention, exhibits a rail (1), upon which can be placed a mounting base (11) as an equipment carrier. The mounting base (11) is not, as usual, so firmly secured, that it cannot be freed without releasing the clamping apparatus, but it is only retained by pressure from a predicted force from a spring. On this account, it is also possible, to manufacture the rail (1) from a plastic material, upon which only a very limited surface pressure can be applied.
