METHOD AND APPARATUS FOR CONSTRUCTING BEHAVIOR TREND MODEL, DEVICE, AND BEHAVIOR DEVIATION DETECTION METHOD

ABSTRACT

Disclosed are a method and apparatus for constructing a behavior trend model, a device, and a behavior deviation detection method. The method for constructing the behavior trend model includes: performing association processing on behavior data sets of a plurality of users to obtain standard behavior data subsets corresponding to the users; dividing the standard behavior data subsets into a plurality of behavior chains based on a preset behavior association rule, the behavior chains being used for combining behavior data in the standard behavior data subsets to form a complete behavior process; determining a stability data set of the behavior chains based on a monitoring period; and constructing the behavior trend model based on the stability data set.
