o

CLAIMS

1. A work time management method for managing a work time of a worker who works more than once in one day; at least one computer executes steps of:

generating a data record including at least a work date and a work start time as a data record corresponding to a work start on a database after the worker starts working, and recording data in the data record; and

extracting a data record recording a latest work start time from data records corresponding to the worker on the database after the worker finish working, and recording work end time to the data record.

2. A work time management method; at least one computer executes steps of:

acquiring information informing a work start of a worker who works more than once in one day, wherein the information includes an ID, a date and a work start time of the worker;

generating a data record including the ID, the date and the work start time;

recording data in the data record;

acquiring information informing a work end of the worker, wherein the information includes the ID, the date and a work end time;

seeking the database based on the acquired ID and the date;

extracting a data record recoding a latest work start time; and

recording acquired work end time in the extracted data record.

3. A work time management method; at least one computer executes steps of:

acquiring information informing a work start of a worker who works more than once in one day, wherein the information includes an ID, a date and work start time of the worker;

generating a data record including the date and the work start time in association with the ID;

recording data in the data record;

acquiring information informing a work end of the worker, wherein the information includes the ID, the date and a work end time;

seeking the database based on the acquired ID and the date;

extracting a data record recoding a latest work start time; and

recording acquired work end time in the extracted data record.

4. A work time management system for managing a work time of a worker who works more than once in one day, the work time management system comprising:

means for generating a data record including at least a work date and a work start time as a data record corresponding to a work start on a database after the worker starts working, and for recording data in the data record; and

means for extracting a data record recording a latest work start time from data records corresponding to the worker on the database after the worker finish working, and for recording a work end time in the data record.

5. A work time management system comprising:

means for acquiring information informing a work start of a worker who works more than once in one day, wherein the information includes an ID, a date and a work start time of the worker;

means for generating a data record including the ID, the date and the work start time;

means for recording data in the data record;

means for acquiring information informing a work end of the worker, wherein the information includes the ID, the date and a work end time;

means for seeking the database based on the acquired ID and the date;

means for extracting a data record recoding a latest work start time; and

means for recording acquired work end time in the extracted data record.

6. A work time management system comprising:

means for acquiring information informing a work start of a worker who works more than once in one day, wherein the information includes an ID, a date and work start time of the worker;

means for generating a data record including the date and the work start time in association with the ID;

means for recording data in the data record;

means for acquiring information informing a work end of the worker, wherein the information includes the ID, the date and a work end time;

means for seeking the database based on the acquired ID and the date;

means for extracting a data record recoding a latest work start time; and

means for recording acquired work end time in the extracted data record.
