7DX – A Framework for Initial Indication of Digital Transformation

ABSTRACT

The patent is a reporting framework designed to provide users with an initial indication of the state of digital transformation for their subject organization/s through a set of seven (7) simple standard questions.

Through this reporting framework, it is possible to identify which of the seven (7) areas of the organization are least innovated versus other areas that are more innovated.

A risk profile is also provided to indicate the non-innovation risk of the subject organization.

The outputs of this reporting framework are, ratings for each of the seven (7) pillars, a chart visualization to show the relative ratings of each pillar, an overall scoring, and a risk level indicator.

Refer to Figure 7.
