ABSTRACT

An elasticated region 10 having an approximate H shape is provided in a part of a wig base. The "approximate H shape" means a shape including a center portion as a base and four protruding portions which extend outwardly from the center portion. The center portion (10a) of the elasticated region is placed at a position which covers a golden point (GP) of the head on the wig base when the wig base is put on the wearer's head. Accordingly, it can efficiently absorb any external forces added to the wig base from front-back, right-left and oblique directions, thereby achieving a high fit feeling.
