Reactant 1 **Reactant 2** **Product**

[1638] DIPEA (3.5 equiv) was added to the solution of 2-((5-carbamoylpyridin-3-yl)amino)-2-oxoacetic acid (1.1 equiv; Reactant 1) and corresponding amine (1.0 equiv; Reactant 2) in DMF (2.0 mL). The resulting mixture was stirred for 5 min followed by the addition of the solution of HATU (1.2 equiv) in DMF (1.0 mL). The reaction mixture was stirred at room temperature overnight. After all starting material was consumed, as was shown by LCMS, the resulting mixture was concentrated under reduced pressure. The residue was subjected to HPLC (C18 column and MeOH-H_2O+ 0.1% NH_3 as a mobile phase, RunTime 5 min) to afford pure product.

[1813] 2-(2-Methyl-1,3-dioxolan-2-yl)propan-1-amine (6.9 g, 47.52 mmol) was dissolved in Toluene (150 mL) and 4-bromobenzaldehyde (8.79 g, 47.52 mmol) was added thereto followed by addition of p-TSA (24.55 g, 142.56 mmol). The resulting mixture was heated to reflux and refluxed under Dean-Stark trap overnight.

[1814] The reaction mixture was cooled and aq. K_2CO_3 solution (50 mL) was added. The resulting mixture was transferred to a separation funnel and an organic layer was separated. The aqueous layer was extracted with EtOAc (50 mL) and combined organic layers were dried over Na_2SO_4, filtered and evaporated. The residue was dissolved in $CHCl_3$ (100 mL) and the resulting mixture was extracted with aq. $NaHSO_4$ (5g in 50 mL of water, 2*50 mL). Combined aqueous

layers were washed with $CHCl_3$ (2*50 mL) and then basified with K_2CO_3 (10 g). The resulting mixture was extracted with $CHCl_3$ (2*50 mL) and combined organic layers were dried over Na_2SO_4, filtered and evaporated to obtain (6R,9R)-9-(4-bromophenyl)-6-methyl-1,4-dioxa-8-azaspiro[4.5]decane (2.7 g, 8.65 mmol, 18.20% yield).

Step 2: The Synthesis of (2R,5R)-2-(4-Bromophenyl)-5-methyl-piperidin-4-one

[1815] (6R,9R)-9-(4-Bromophenyl)-6-methyl-1,4-dioxa-8-azaspiro[4.5]decane (2.7 g, 8.65 mmol) was dissolved in 6N HCl (80 mL) and the resulting mixture was heated at 80 °C (in an oil bath) overnight. The reaction mixture was cooled, extracted with MTBE (twice) then the aqueous layer was basified with K_2CO_3. The resulting mixture was extracted with $CHCl_3$ (twice) and combined organic layers were dried over Na_2SO_4, filtered and evaporated to obtain (2R,5R)-2-(4-bromophenyl)-5-methyl-piperidin-4-one (1 g, 3.73 mmol, 43.12% yield).

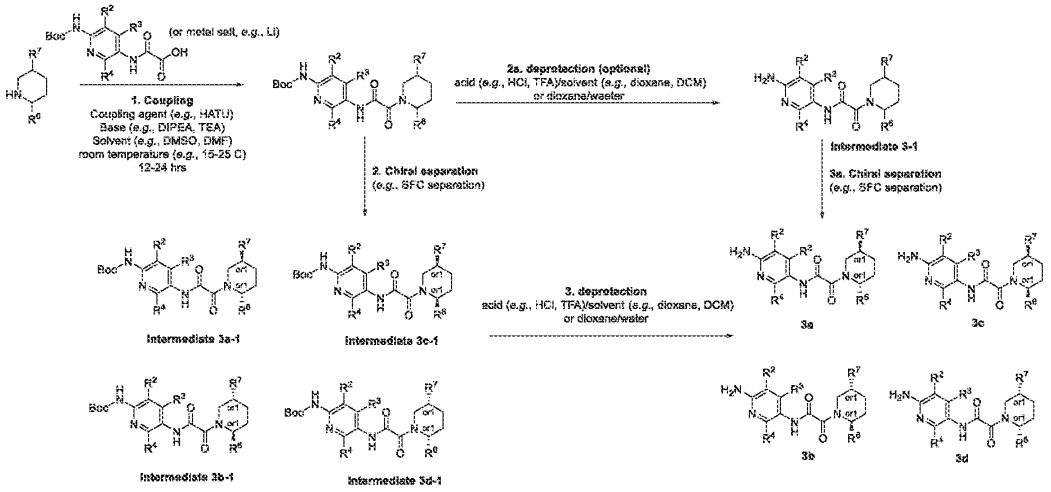
Scheme C. Synthesis of Compounds of Formula 3

[1910] Compounds of Formula 3, 3a, 3b, 3c and 3d are compounds of Formula (I), (Ia), (Ib), (Ic) and (Id) wherein R^1 is NH_2 and R^2, R^3, R^4, R^6, R^7, and R^8 are as described herein

General Procedure 3



[1911] Note that the separation step is optional and is used in certain cases to separate the cis/trans diastereomes, and in certain cases to separate distinct enantiomers, as described in the detailed procedures. In certain instances, the starting piperidine is in a defined cis or trans configuration – in those instances, the chiral separation step results only in two of the four enantiomers depicted.

[1912] As shown in Scheme C , compounds of Formula (3a), (3b), (3c), and (3d) can be separated from a mixture of compounds of Formula (3-1), wherein R^1, R^2, R^3, R^4, R^6, R^7, R^8, and n are as described herein. Methods of chiral separation are known to persons of ordinary skill in the art. For example, in some embodiments, chiral separation can be accomplished through the use of chiral HPLC purification (Column: AD-H III (250*20 mm, 5 μm). Exemplary eluents include, but are not limited to, hexane, IPA, MeOH, MeCN, and H_2O, and mixtures thereof.

[1913] Alternatively, compounds of Formula (3a), (3b), (3c), and (3d) can be prepared from Intermediates (3a-1), (3b-1), (3c-1), and (3d-1). In some embodiments, deprotection can take place before or after chiral separation. Conditions for removing a protecting group -PG (*e.g*, -Boc) can employ, for example, acidic conditions, (*e.g.*, water/dioxane, hydrochoric acid in a

protic solvent (*e.g.*, methanol), hydrochloric acid in an aprotic solvent (*e.g.*, dioxane), TFA in an an aprotic solvent (*e.g.*, dichoromethane, chloroform, etc)). In some emboidments, a deproction step employs HCl (4.0M) in dioxane. In some emboidments, a deproction step employs HCl (4.0M) in DCM.

[1914] In some embodiments, compounds of the present disclosure can be prepared through a method that comprises an amide bond coupling. In some embodiments, an amide bond coupling employs a piperadine and a carboxylic acid. Examples of conditions known to facilitate an amide bond coupling include but are not limited to adding a coupling agent such as CDI, HATU, HOBT, HBTU or PyBOP, a base such as a hydride base *e.g.*, NaH, or KH, an amine base such as DBU, NEt_3, and $NEt(^iPr)_2$ or a carbonate base *e.g.*, Na_2CO_3, K_2CO_3, or Cs_2CO_3, and in one embodiment stirring a reaction at 0 °C to room temperature or another embodiment at a temperature of 70 °C or higher, for example at a temperature in a range of 70 °C to 110 °C, or in a range of 70 °C to 80 °C, or at 80 °C. A reaction may be carried out in solvents such as but not limited to DMF, and MTBE. In some embodiments, a reaction comprises comprises of HATU, Et_3N, and DMF. In some embodiments, a reaction comprises comprises of HATU, DIPEA, and DMSO. In some embodiments, a reaction comprises comprises of HATU, DIPEA, and DMF. In some embodiments, a reaction comprises comprises of HATU, TEA, and DMSO.

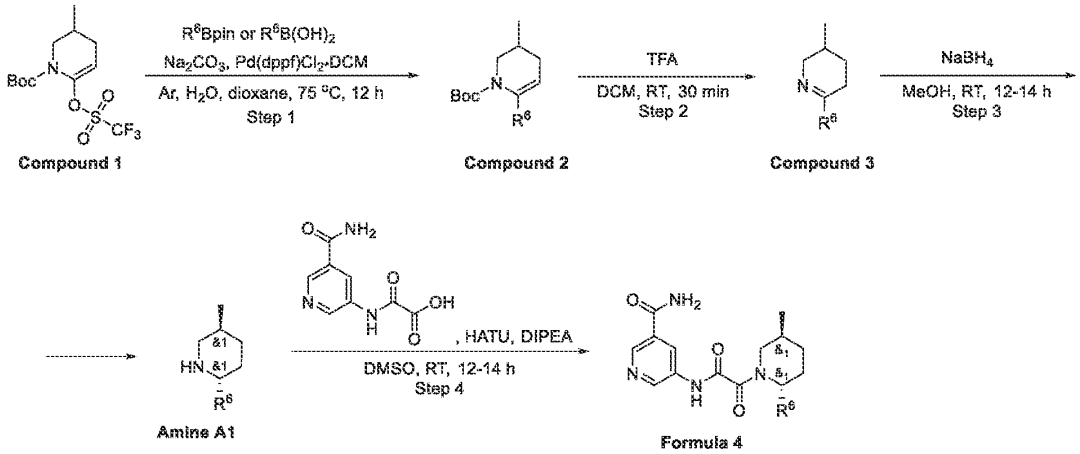
[2405] Compounds of Formula 4 are compounds of Formula (I), (Ia) and (Ib) wherein R^1 is H, R^2 is -C(=O)NH_2, R^3, R^4 and R^8 are H, R^7 is -Me

General Procedure 4



[2406] *Step 1: Compound 1* (1.0 eq), corresponding boronic acid (1.25 eq), sodium carbonate (3 eq), $Pd(dppf)Cl_2$*DCM (0.04 eq), water (1 mL) and 1,4-dioxane (2 mL) were placed in 8 ml vial and charged with Ar in glove box. The reaction mixture was stirred at 75 °C for 12 hr. After cooling to RT, water (4 mL) was added into vial and the mixture was extracted with DCM. Separated organic layer was concentrated to afford crude **compound 2** which was used in the next step without additional purification.

[2407] *Step 2:* To a solution of crude **compound 2** in DCM (0.5 mL), TFA (0.5 mL) was added. The reaction mixture was stirred at RT for 30 min. Then, the resulting mixture was evaporated and the residue was dissolved in DCM (5 mL). The organic layer was washed twice with aqueous solution of NaOH and concentrated under reduced pressure to afford crude **compound 3** which was used in the next step without purification.

[2408] *Step 3*: $NaBH_4$ (1.1 eq) was added in one portion to a solution of crude **compound 3** (1 eq) in methanol (4 mL). The reaction mixture was stirred overnight and evaporated. The residue was dissolved in DCM (5 mL) and washed with water twice. The organic layer was concentrated *in vacuo* to afford crude **Amine A1** which was used in the next step without purification.

[2409] *Exemplary coupling procedure 1:* The amine A1 (~1 eq), 2-((5-carbamoylpyridin-3-yl)amino)-2-oxoacetic acidtriethylammonium salt (~1.1 eq), HATU (1.1 eq), DIPEA (1.5 eq) were stirred in DMSO overnight. After LCMS confirmation of presence of the desired product, the reaction mixture was submitted to HPLC (Sunfire C18 19*100 5 mkm column, H_2O-MeOH as a mobile phase, Flow 15 ml/min, RunTime 5 min) to afford pure compounds of **Formula 4**.

[2410] *Exemplary coupling procedure 2*: 2-[(5-carbamoyl-3-pyridyl)amino]-2-oxo-acetic acid (~1eq), HATU (~1.1eq) and Triethylamine (~3eq) were mixed in dry DMF at 21 °C and the resulting mixture was stirred for 12 hr. Amine A1 (~1eq) was added thereto and the resulting mixture was stirred at 21 °C overnight. The resulting mixture was poured into water, extracted 3 times with EtOAc, combined organics were washed with water, brine and evaporated. The residue was subjected to HPLC (*e.g.*, (0-5min 20-70% water-methanol (NH_3 0.1%), flow 30ml/min to (loading pump 4ml/min methanol (NH_3 0.1%)), column: YMC-Actus Triart C18 100*20 mmI.D. The molar ratio of the reagents and reaction conditions were kept the same in each reaction of the series. The yields and the LC-MS and NMR description of the final products are presented on the following pages. All boronic acids and pinacolates are commercial Enamine stock.

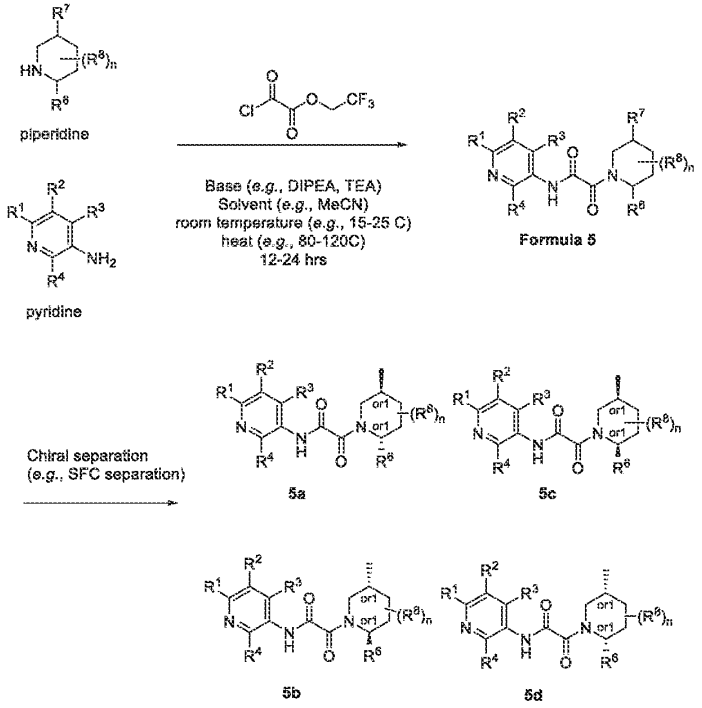
Scheme E – Synthesis of compounds of Formula 5

[2494] Compounds of Formula 5 are compounds of Formula (I) wherein R^1, R^2, R^3, R^4, R^6, R^7, and R^8 are as described herein

General Procedure 5



[2495] Note that the separation step is optional and used in certain cases to separate the cis/trans diastereomes, and in certain cases to separate distinct enantiomers, as described in the detailed procedures. In certain instances, the starting piperidine is in a defined cis or trans configuration – in those instances, the chiral separation step results only in two of the four enantiomers depicted

General library procedure

DIPEA (1.5 equiv + 1.0 equiv if salt forms of reactants were used) was added to the solution of pyridine reactant (1.0 equiv) in MeCN (0.7 mL). The resulting mixture was stirred for 30 min at room temperature followed by the dropwise addition of 2,2,2-trifluoroethyl 2-chloro-2-oxoacetate (1.0 equiv). Then, the mixture was stirred for additional 30 min and the piperidine reactant (1.1 equiv) was added. The reaction mixture was stirred for 1 h at room temperature and then for 16 h at 100 °C. After that, the resulting mixture was allowed to cool to room temperature and MeOH (2.0 mL) was added. The suspension was stirred until the clear solution was observed and SiliaMetS DMT (Dimercaptotriazine) (50.0 mg) was added. The obtained suspension was stirred for 30 min at room temperature and filtered off. The filtrate was concentrated under reduced pressure and the residue was re-dissolved in DMSO (0.5 mL). The

resulting solution was subjected to HPLC (Agilent 1260 Infinity systems equipped with DAD and mass-detector; Waters SunFire C18 OBD Prep Column, 100 A, 5mkm, 19*100 mm with SunFire C18 Prep Guard Cartridge, 100 A, 10 mkm, 19*100 mm; MeOH-H_2O as a mobile phase, Run Time 5 min) to afford a product of formula 5.

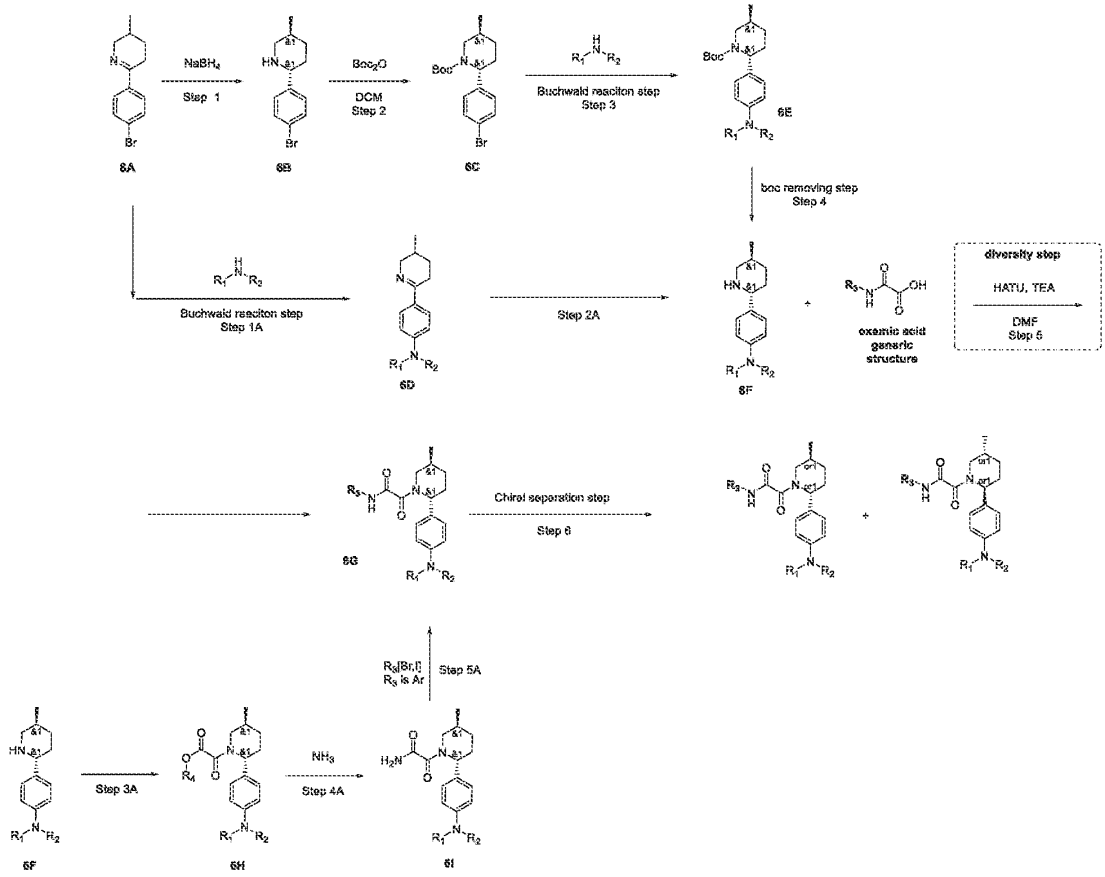
General Procedure 6



Step 1: The Synthesis of 6B

[2501] To a solution of **6A** (1.0 equiv), Sodium Borohydride (1.0 equiv) was added portionwise at 0 °C. The resulting mixture was stirred for 2 hr at room temperature and the volatiles were removed *in vacuo*. The residue was diluted with water (2 mL) and extracted with DCM (3*4 mL). Organic layer was dried over Na_2SO_4 and solvent was removed *in vacuo* to obtain **6B.**

Step 1A: The Synthesis of 3.1D

[2502] To a stirred solution of **6A** (1.0 equiv) in Solvent (5 mL) was added Base (2.5 equiv). The resulting suspension was degassed with argon. Ligand (0.05 equiv) and Pd cat (0.05 eqiv) was added. The reaction mixture was stirred at 70…100 °C for 14…36 hr. After the completion of the reaction (monitored by LCMS), the resulting mixture was allowed to cool to the room

temperature, filtered through a thin layer of SiO_2 and washed with solvent (2 mL). The volatiles were removed *in vacuo* and the residue was subjected for purification to afford **6D**.

The resulting mixture was stirred at 25 °C for 4 hr. Then, volatiles were removed under reduced pressure to afford **Compounds and Methods of Use**

Step 2A: The Synthesis of 6F

[2504] To a solution of **6D** (1.0 equiv), Sodium Borohydride (1.0 equiv) was added portionwise at 0 °C. Step 3A: The Synthesis of 6H

[2506] A solution benzyl 2-chloro-2-oxo-acetate (1.1 equiv) in MeCN (2 mL) was added dropwise at 0°C to a stirred solution of **6F** (1.0 equiv) and DIPEA (2.5 equiv) in MeCN (4 mL). The reaction mixture was allowed to warm to 25 °C and stirred for 12 hr. Then, the volatiles were evaporated *in vacuo*. The residue was subjected to HPLC purification to afford **6I.**

Step 4: The Synthesis 6F

[2507] **6E** (1.0 equiv) was dissolved in Solvent (2…10 mL) and Acid (50.0 equiv) was added. The reaction mixture was stirred at room temperature for 1…4 h. The solvent was removed *in vacuo* to obtain **6F.**.

Boc-removing step:

Method	Acid	Solvent	Temperature	Time
A	HCl (4.0M soln in diox)	MeOH	RT	30 min…12 h
B	TFA	DCM	20…50 °C	1 h
C	H_2O	Dioxane	100 °C	12…16 h

Step 4A: The Synthesis 6I

[2508] The solution of 6H (1.0 equiv) was mixed with Ammonia solution in MeOH (20.0 equiv) and heated at 45 °C for 12 hours. Then, the volatiles were removed *in vacuo* to afford **6I.**

Step 5: The Synthesis 6G

[2509] **6F** (1.0 equiv), oxamic acid (1.0 equiv) and TEA (2.5 eq+1.0 eq per each acid eq, if amine salt used) or DIPEA (2.5 eq+1.0 eq per each acid eq, if amine salt used) were mixed together in DMF or DMS+SO. HATU (1.5 eq) was added thereto and the resulting mixture was stirred overnight. The reaction mixture was concentrated *in vacuo* and the residue was purified by HPLC to obtain **6G**.

Step 5A: The Synthesis of 6G

[2510] **6I** (1.0 equiv), R3I (1.0 equiv), CuI (0.2 equiv), CuI (0.2 equiv), N^1,N^2-dimethylcyclohexane-1,2-diamine (0.2 equiv) and Cs_2CO_3 were mixed together in dioxane (6 mL) under an Ar atmosphere. The reaction mixture was stirred at 100 °C for 48 h. Then, the mixture was allowed to cool to the room temperature and filtered off. The filtrate was subjected to HPLC to afford 6G.

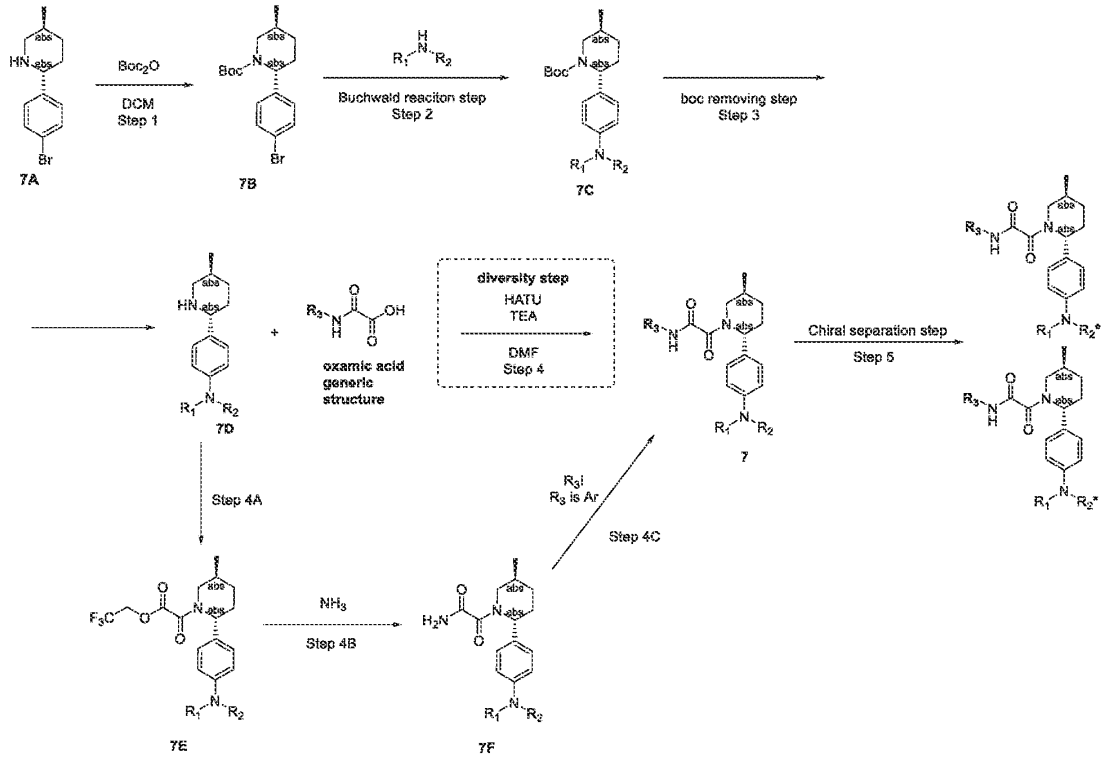
Scheme G – Synthesis of Compounds of Formula 7

[2566] Compounds of Formula 7 are are compounds of Formula (I) wherein R^1, R^2, R^3, R^4, R^6 R^7, and R^8 are as described herein.

General Procedure 7



Step 1: The Synthesis of 7B

[2567] **7A** (1.0 equiv) was dissolved in DCM (280 mL) and a solution of di-*tert*-butyl dicarbonate (1.02 equiv) in DCM (20 mL) was added dropwise (vigorous gas evolution!). The resulting mixture was stirred at 20 °C for 4 hr. Then, the volatiles were removed under reduced pressure, affording crude product which was purified by FCC ($CHCl_3$-MeCN from 100%-0% to 0%-100%) to give *tert*-butyl (2R,5S)-2-(4-bromophenyl)-5-methyl-piperidine-1-carboxylate **(7B)**.

Step 2: The Synthesis of 7C

[2568] To a stirred solution of *tert*-butyl (2R,5S)-2-(4-bromophenyl)-5-methyl-piperidine-1-carboxylate (**7B**; 1.0 equiv) and respective amine (1.0 equiv) in Solvent (5 mL) was added Base (2.5 equiv). The resulting suspension was degassed with argon. Ligand (0.05 equiv) and Pd cat (0.05 eqiv) was added. The reaction mixture was stirred at 65…100 °C for 15…48 hr. After the

completion of the reaction (monitored by LCMS), the resulting mixture was allowed to cool to the room temperature, filtered through a thin layer of SiO_2 and washed with solvent (2 mL). The volatiles were removed *in vacuo* and the residue was subjected for purification to afford 7C.

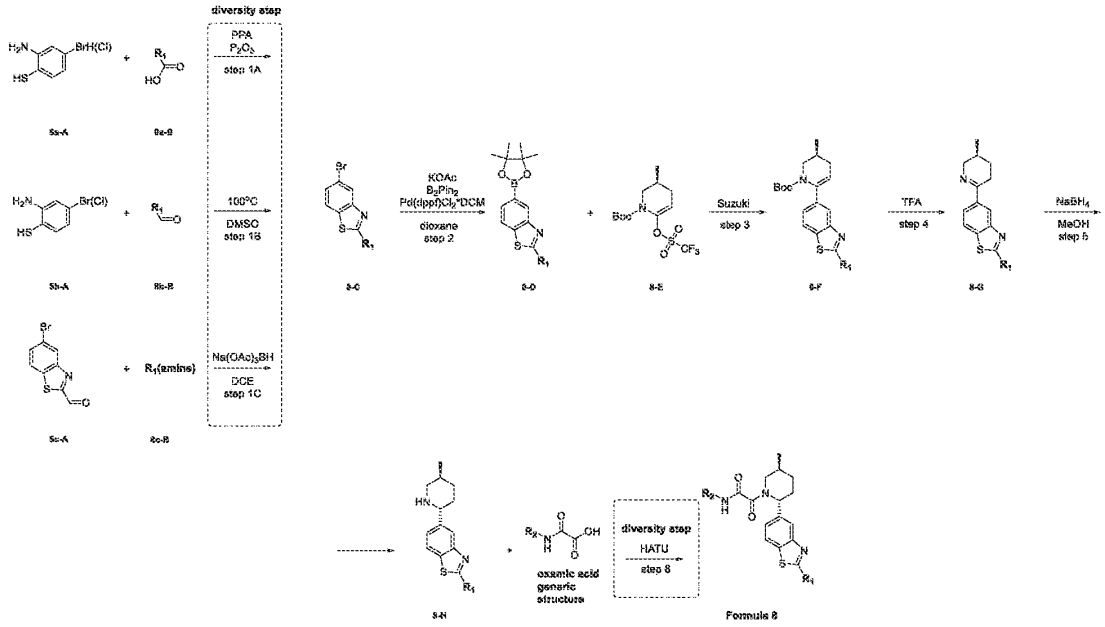
Scheme H – Synthesis of Compounds of Formula 8

[2586] Compounds of Formula 8 are are compounds of Formula (I) wherein R^1, R^2, R^3, R^4, R^6 R^7, and R^8 are as described herein.

General Procedure 8

Scheme H



Step 1A: Synthesis of 8-C

[2587] Phosphoric acid (4 eq) and phosphorus pentoxide (4 eq) were mixed together. The reaction suspension was stirred at rt for 10 min, then 8a-A (1 eq) followed by 8a-B (1.2 eq) were added under Ar. The solution was stirred at 110°C for 18 hr then it was triturated with water, basidified (NaOH, 10% aq.) to pH=10, extracted with DCM twice, dried and evaporated in vacuum to give 8-C.

Step 1B: Synthesis of 8-C

[2588] To the stirred solution of 8b-A (1 eq) in DMSO 8b-B (1 eq) was added. The resulting mixture was stirred at 100°C for 14 hr. The reaction mixture was poured into cold water and extracted with MTBE twice. Combined organic layers were washed with water and brine, dried over Na_2SO_4. MTBE was evaporated in vacuum to give 8-C.

Step 1C: Synthesis of 8-C

[2589] To the stirred solution of 8c-A (1eq) in the 1,2-dichloroethane 8c-B (2 eq) was added and allowed to stir at 25°C for 2 hr, sodium (trisacetoxy) borohydride (2 eq) was added. The reaction mixture was stirred at 25°C for 16 hr. After completion, the reaction mixture was evaporated, quenched with water and neutralized by K_2CO_3 to pH=10. The aqueous phase was extracted with $CHCl_3$ twice. The combined organic phase was dried over Na_2SO_4 and evaporated under reduced pressure to afford 8-C. (TEA 1.5 eq per each acid eq, if amine salt used, was added to the solution of respective amine)

Step 2: Synthesis of 8-D

[2590] 8-C (1 eq), B_2Pin_2 (1.1 eq) and KOAc (2 eq) were mixed in dioxane. The resulting mixture was evacuated and then backfilled with argon, this operation was repeated three times, then Pd(dppf)Cl_2*DCM (0.05 eq) was added under argon. The reaction mixture was stirred under argon at 90°C for 14 hr, then cooled and filtered. The filter cake was washed with dioxane twice. The solvent was evaporated to afford 8-D.

Step 3: Synthesis of 8-F

[2591] 8-D (1 eq), *tert*-butyl (*3S*)-3-methyl-6-(trifluoromethylsulfonyloxy)-3,4-dihydro-*2H*-pyridine-1-carboxylate (1.2 eq) , sodium carbonate (3 eq) were mixed together in dioxane-water mixture (3:1). The resulting mixture was evacuated and then backfilled with argon. This operation was repeated two times, then Pd(dppf)Cl_2*DCM (819.86 mg, 1.00 mmol) was added and the reaction mixture was stirred under argon at 90°C overnight , then cooled down and concentrated in vacuum. The residue was diluted with MTBE and stirred for 0.5 hr. After the most of the residue had dissolved, anhydrous sodium sulphate was added, and the resulting mixture was filtered. The filter cake was additionally washed with MTBE (5*50 ml) and discarded. The filtrate was concentrated in vacuum to afford 8-F.

Step 4: Synthesis of 8-G

[2592] A solution of 8-F (1 eq) in TFA (15 eq) was stirred at rt for 1 hr, and then concentrated in vacuum. Cold water was added to the residue, and the resulting mixture was extracted with DCM twice. The DCM layer was discarded, and the aqueous layer was basified to pH 11. The resulting mixture was extracted with DCM twice. The combined organic extracts were dried over sodium sulphate and concentrated in vacuum to afford 8-G.

Step 5: Synthesis of 8-H

[2593] 8-G (1 eq) was dissolved in MeOH and the resulting solution was cooled to 0°C in an ice bath. Sodium borohydride (2 eq) was added portion wise to the previous solution. After addition completed, the reaction mixture was allowed to warm to rt and stirred overnight. Water was added to the reaction mixture and the resulting mixture was concentrated in vacuum. The residue was diluted with water and the resulting mixture was extracted with DCM twice, dried over Na_2SO_4, filtered and evaporated to obtain 8-H.

Step 6A: Synthesis of Formula 8

[2594] 8-H (1 eq), oxamic acid (1 eq) and TEA (2.5 eq+1.0 eq per each acid eq, if amine salt used) were mixed together in DMF. HATU (1.5 eq) was added thereto and the resulting mixture was stirred overnight. The reaction mixture was concentrated in vacuum and the residue was purified by HPLC to obtain Formula 8.

Step 6B: Synthesis of Formula 8

[2595] DIPEA (2.5 eq+1.0 eq per each acid eq, if amine salt used) was added to the solution of respective amine or it salt (8-H) (1 eq) and oxamic acid (1 eq) in DMF. The resulting mixture was stirred for 5 min followed by the addition of the solution of HATU (1.1 eq) in DMF. Then, the reaction mixture was stirred overnight at rt. After the completion of the reaction, monitored by LCMS, the resulting suspension was concentrated under reduced pressure. The obtained filtrate was subjected to HPLC (Waters SunFire C18 19*100 5 mkm column and H_2O-MeOH as a mobile phase) to afford pure product (Formula 8).

Step 2: Synthesis of (3-(5-chlorobenzo[d]thiazol-2-yl)oxetan-3-yl)methanamine

[2771] Crude MTBE solution of 2-[3-(azidomethyl)oxetan-3-yl]-5-chloro-1,3-benzothiazole (11 g, 39.18 mmol) (approximately 50 mL) was diluted with methanol (100 mL) and ammonium chloride (12.58 g, 235.10 mmol, 8.22 mL) was added. Zinc (7.69 g, 117.55 mmol) dust was added potion wise with stirring at 25°C to the above mixture. The reaction mixture was stirred at 25°C for 12 hr , and then filtered. The filter cake was washed with MeOH (2*25 mL) and discarded. The combined filtrate was concentrated in vacuum. The residue was diluted with MTBE (100mL) and extracted with 5% aqueous sodium hydrogen sulphate solution (100 mL). The resulting aqueous solution of amine hydrogen sulphate was then basified to pH 11 with 10% aqueous sodium hydroxide solution and extracted with DCM (2*50 mL). The combined organic extracts were dried over sodium sulphate and concentrated in vacuum to afford crude [3-(5-

chloro-1,3-benzothiazol-2-yl)oxetan-3-yl]methanamine (1.2 g, 4.71 mmol, 12.02% yield) as light-yellow gum, which was used directly in the next step.

Step 3: Synthesis of 1-(3-(5-chlorobenzo[d]thiazol-2-yl)oxetan-3-yl)-N,N-dimethylmethanamine

[2772] Formaldehyde, 37% w/w aq. soln., stab. with 7-8% MeOH (946.16 mg, 11.66 mmol, 873.64 µL, 37% purity) and acetic acid (518.63 mg, 8.64 mmol, 494.41 µL) were added to a stirred solution of [3-(5-chloro-1,3-benzothiazol-2-yl)oxetan-3-yl]methanamine (1.1 g, 4.32 mmol) in MeOH (30.49 mL) at 25°C. The resulting mixture was stirred at 25°C for 1 hr, then sodium cyanoborohydride (542.73 mg, 8.64 mmol) was added in one portion at 25°C (foaming!). The reaction mixture was stirred at 25°C for 12 hr , and then concentrated in vacuum. The residue was diluted with 10% aqueous sodium hydroxide solution (20 mL) and extracted with DCM (2*20 mL). The combined organic extracts were dried over sodium sulphate and concentrated in vacuum to afford crude 1-[3-(5-chloro-1,3-benzothiazol-2-yl)oxetan-3-yl]-*N,N*-dimethyl-methanamine (1.3 g, crude) as light-yellow gum, which was used directly in the next step.

[2773] A mixture of 1-[3-(5-chloro-1,3-benzothiazol-2-yl)oxetan-3-yl]-*N,N*-dimethyl-methanamine (1.4 g, 4.95 mmol) , 4,4,5,5-tetramethyl-2-(4,4,5,5-tetramethyl-1,3,2-dioxaborolan-2-yl)-1,3,2-dioxaborolane (1.38 g, 5.45 mmol) and potassium acetate (971.72 mg, 9.90 mmol, 618.93 µL) in dioxane (35 mL) was evacuated and then backfilled with argon. This operation was repeated two times, then *tris*(1,5-diphenylpenta-1,4-dien-3-one) dipalladium (226.67 mg, 247.53 µmol) and dicyclohexyl[2',4',6'-tris(propan-2-yl)-[1,1'-biphenyl]-2-yl]phosphane (472.02 mg, 990.14 µmol) were added under argon, and the reaction mixture was stirred at 95°C for 18 hr. The reaction mixture was cooled down and filtered. The filter cake was washed with dioxane (2*10 mL) and discarded. The combined filtrate was concentrated in vacuum. The residue was diluted with DCM (30 mL) and extracted with a solution of sodium hydrogen sulphate (1.19 g, 9.90 mmol) in water (20 mL) (repeated two times). The combined aqueous layer was basified to pH 10 with 10% aqueous sodium hydroxide solution and back-extracted with DCM (3*25 mL). Evaporation of both DCM extracts does not showed desired product. It seemed like boronic ester

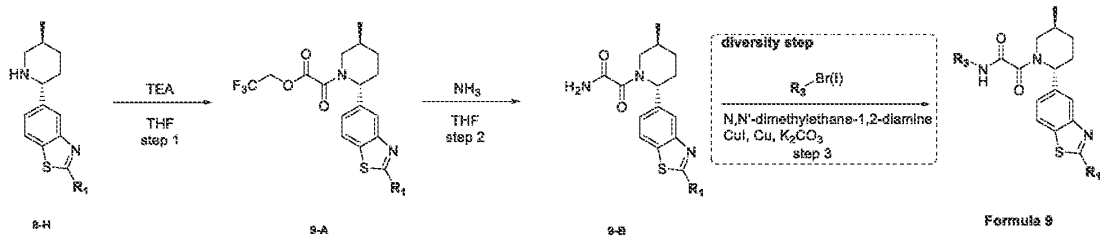
Scheme I – Synthesis of Compounds of Formula 9

[3051] Compounds of Formula 9 are are compounds of Formula (I) wherein R^1, R^2, R^3, R^4, R^6 R^7, and R^8 are as described herein.

General Procedure 9

Scheme I



Step 1: Synthesis of 9-A

[3052] **8-H** was described in scheme H.

[3053] 8-H (1 eq) and TEA (1.1 eq) were dissolved in THF and cooled to 0°C, following by the dropwise addition of 2,2,2-trifluoroethyl 2-chloro-2-oxo-acetate (1.1 eq) under Ar and the reaction mixture was stirred for 12 hr at rt and evaporated under reduced pressure to give 9-A which was used in the next step without further purification.

Step 2: Synthesis of 9-B

[3054] To a solution of 9-A (1 eq) in THF (10 mL), ammonia (1 eq) was bubbled through for 10 min at 0°C. The reaction mixture was then stirred for 18 hr at rt. Scheme J – Synthesis of Compounds of Formula 10

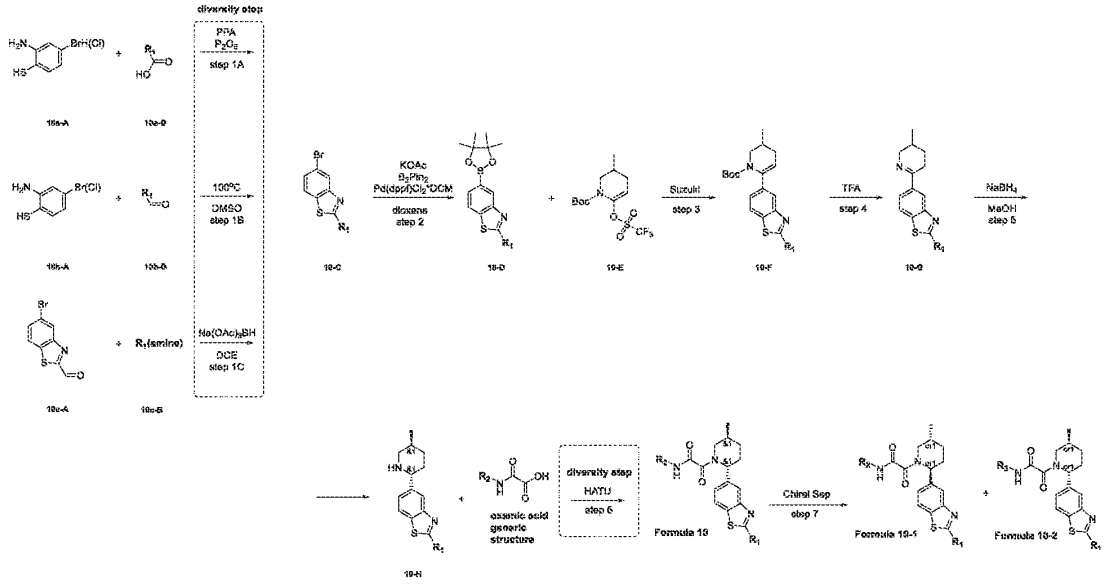
[3059] Compounds of Formula 10 are are compounds of Formula (I) wherein R^1, R^2, R^3, R^4, R^6 R^7, and R^8 are as described herein.

General Procedure 10

Scheme J



Step 1A: Synthesis of 10-C

[3060] Phosphoric acid (4 eq) and phosphorus pentoxide (4 eq) were mixed together. The reaction suspension was stirred at rt for 10 min, then 10a-A (1 eq) followed by 10a-B (1.2 eq) were added under Ar. The solution was stirred at 110°C for 18 hr then it was triturated with water, basidified (NaOH, 10% aq.) to pH=10, extracted with DCM twice, dried and evaporated in vacuum to give 10-C.

Step 1B: Synthesis of 10-C

[3061] To the stirred solution of 10b-A (1 eq) in DMSO 4.1b-B (1 eq) was added. The resulting mixture was stirred at 100°C for 14 hr. The reaction mixture was poured into cold water and extracted with MTBE twice. Combined organic layers were washed with water and brine, dried over Na_2SO_4. MTBE was evaporated in vacuum to give 10-C.

Step 1C: Synthesis of 10-C

[3062] To the stirred solution of 10c-A (1eq) in the 1,2-dichloroethane 10c-B (2 eq) was added and allowed to stir at 25°C for 2 hr, sodium (trisacetoxy) borohydride (2 eq) was added. The reaction mixture was stirred at 25°C for 16 hr. After completion, the reaction mixture was evaporated, quenched with water and neutralized by K_2CO_3 to pH=10. The aqueous phase was extracted with $CHCl_3$ twice. The combined organic phase was dried over Na_2SO_4 and evaporated

under reduced pressure to afford 10-C. (TEA 1.5 eq per each acid eq, if amine salt used, was added to the solution of respective amine)

Step 2: Synthesis of 10-D

[3063] 10-C (1 eq), B_2Pin_2 (1.1 eq) and KOAc (2 eq) were mixed in dioxane. The resulting mixture was evacuated and then backfilled with argon, this operation was repeated three times, then $Pd(dppf)Cl_2$*DCM (0.05 eq) was added under argon. The reaction mixture was stirred under argon at 90°C for 14 hr, then cooled and filtered. The filter cake was washed with dioxane twice. The solvent was evaporated to afford 10-D.

Step 3: Synthesis of 10-F

[3064] 10-D (1 eq), *tert*-butyl 3-methyl-6-(trifluoromethylsulfonyloxy)-3,4-dihydro-*2H*-pyridine-1-carboxylate (1.2 eq) , sodium carbonate (3 eq) were mixed together in dioxane-water mixture (3:1). The resulting mixture was evacuated and then backfilled with argon. This operation was repeated two times, then $Pd(dppf)Cl_2$*DCM (819.86 mg, 1.00 mmol) was added and the reaction mixture was stirred under argon at 90°C overnight , then cooled down and concentrated in vacuum. The residue was diluted with MTBE and stirred for 0.5 hr. After the most of the residue had dissolved, anhydrous sodium sulphate was added, and the resulting mixture was filtered. The filter cake was additionally washed with MTBE (5*50 ml) and discarded. The filtrate was concentrated in vacuum to afford 10-F.

Step 4: Synthesis of 10-G

[3065] A solution of 10-F (1 eq) in TFA (15 eq) was stirred at rt for 1 hr, and then concentrated in vacuum. Cold water was added to the residue, and the resulting mixture was extracted with DCM twice. The DCM layer was discarded, and the aqueous layer was basified to pH 11. The resulting mixture was extracted with DCM twice. The combined organic extracts were dried over sodium sulphate and concentrated in vacuum to afford 10-G.

Step 5: Synthesis of 10-H

10-G (1 eq) was dissolved in MeOH and the resulting solution was cooled to 0°C in an ice bath. Sodium borohydride (2 eq) was added portion wise to the previous solution. After addition completed, the reaction mixture was allowed to warm to rt and stirred overnight. Water was added to the reaction mixture and the resulting mixture was concentrated in vacuum. The residue was diluted with water and the resulting mixture was extracted with DCM twice, dried over Na_2SO_4, filtered and evaporated to obtain 10-H.

Step 6A: Synthesis of Formula 10

[3066] 10-H (1 eq), oxamic acid (1 eq) and TEA (2.5 eq+1.0 eq per each acid eq, if amine salt used) were mixed together in DMF. HATU (1.5 eq) was added thereto and the resulting mixture was stirred overnight. The reaction mixture was concentrated in vacuum and the residue was purified by HPLC to obtain Formula 10.

Step 6B: Synthesis of Formula 10

[3067] DIPEA (2.5 eq+1.0 eq per each acid eq, if amine salt used) was added to the solution of respective amine or it salt (10-H) (1 eq) and oxamic acid (1 eq) in DMF. The resulting mixture was stirred for 5 min followed by the addition of the solution of HATU (1.1 eq) in DMF. Then, the reaction mixture was stirred overnight at rt. After the completion of the reaction, monitored by LCMS, the resulting suspension was concentrated under reduced pressure. The obtained filtrate was subjected to HPLC (Waters SunFire C18 19*100 5 mkm column and H_2O-MeOH as a mobile phase) to afford pure product (Formula 10).

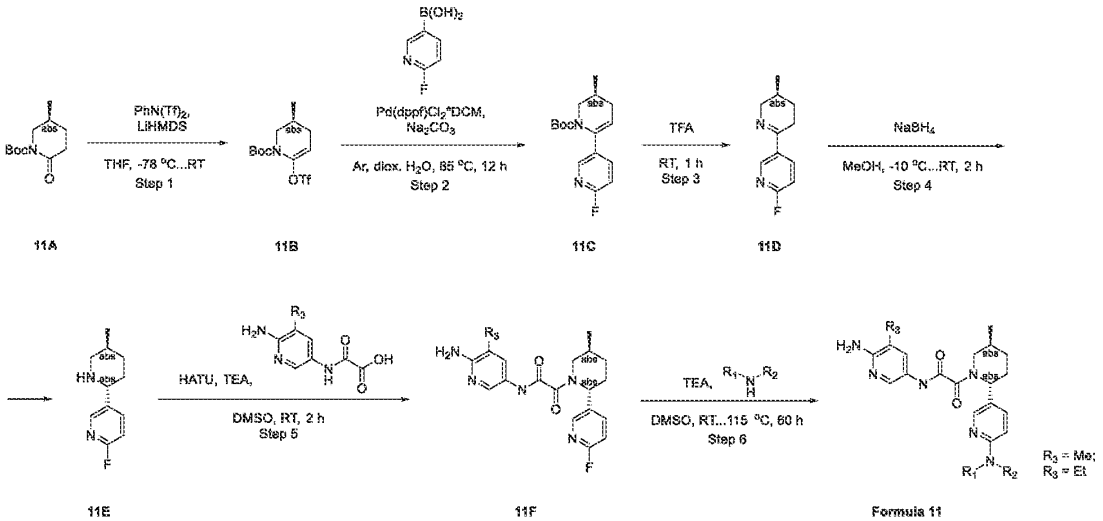
Scheme K – Synthesis of Compounds of Formula 11

[3093] Compounds of Formula 11 are are compounds of Formula (I) wherein R^1, R^2, R^3, R^4, R^6 R^7, and R^8 are as described herein.

General Procedure 11

Scheme K



Step 1: The Synthesis of 11B

[3094] LiHMDS (1.3 equiv; 1.08 M in THF/ethylbenzene) was added dropwise under argon to a cooled to -78 °C solution of **11A** (1.0 equiv) in THF (400 mL). The resulting solution was stirred at -78 °C for 1.5 hr following by the addition of 1,1,1-trifluoro-N-phenyl-N-(trifluoromethylsulfonyl)methanesulfonamide (1.05 equiv). The reaction mixture was allowed to warm slowly (cooling bath was not removed!) to 25 °C and stirred for 12 hr. Then, the mixture was diluted with water (100 mL) and MTBE (700 mL). The organic layer was separated, the aqueous layer was additionally extracted with MTBE (200 mL). The combined organic extracts were washed with 10% aqueous sodium hydroxide solution (2*100 mL), dried over potassium carbonate (250 g) and concentrated *in vacuo*. The residue was diluted with hexane/MTBE mixture (4/1,500 ml, repeated 8 times) and stirred for 30 min. The resulting cloudy solution was decanted from oily residue, filtered through a short pad of silica gel (150 mL of dry silica gel) and evaporated *in vacuo* to afford **11B.**

Step 2: The Synthesis of 11C

[3095] **11B** (1.0 equiv), (6-fluoro-3-pyridyl)boronic acid (1.38 equiv) and Sodium carbonate (3.05 equiv) were added to a mixture of 1,4-dioxane (100 mL) and water (30 mL). The resulting mixture was evacuated and then backfilled with argon, this operation was repeated three times, then Pd(dppf)Cl_2*DCM (0.05 equiv) was added under argon. The reaction mixture was stirred under argon at 85 °C for 18 hr. The resulting mixture was allowed to cool to the room temperature and filtered. The filtercake was washed with dioxane (2*50 mL) and discarded. The filtrate was concentrated *in vacuo*, and the residue was twice purified by column chromatography on silica gel using hexane/MTBE gradient (0-100% MTBE) to afford **11C.**

Step 3: The Synthesis of 11D

[3096] A solution of **11C** (1.0 equiv) in Trifluoroacetic acid (50.0 mL) was stirred at 25 °C for 1 hr, and then concentrated *in vacuo*. Crushed ice (10 g) was added to the residue, and the resulting mixture was basified to pH 10 with 10% aqueous potassium carbonate solution and extracted with dichloromethane (2*100.0 mL). The combined organic extracts were dried over sodium sulphate and concentrated under reduced pressure to afford **11D**.

Step 4: The Synthesis of 11E

[3097] Sodium Borohydride (2.14 equiv) was added in one portion to a stirred solution **11D** (1.0 equiv) in methanol (50 mL) at -10 °C. The resulting mixture was stirred at -10 °C for 30

min, and was allowed to warm to 25°C and stirred for 1 hr. The reaction mixture was concentrated *in vacuo*, the residue was diluted with water (30.0 mL) and extracted with dichloromethane (2*100.0 mL). The combined organic extracts were dried over sodium sulphate and concentrated *in vacuo* to afford **11E.**

Step 5: The Synthesis of 11F

[3098] HATU (1.15 equiv) was added in small portions over 30 min to a stirred mixture of **11E** (1.0 equiv), 2-[(6-amino-5-methyl/ethyl-3-pyridyl)amino]-2-oxo-acetic acid (1.25 equiv) and triethyl amine (6.0 equiv) in DMSO (22.0 mL) at 25 °C. The resulting mixture was stirred at 25 °C for 2 hr. The mixture was analyzed with LCMS and the reaction mixture was used directly in the next step.

Step 6: The Synthesis of Formula 9

Method A:

[3099] **Respective amine** (2.5 equiv) was added to the reaction mixture from previous step containing **11F** (1.0 equiv). The resulting mixture was stirred in sealed vial at 115 °C for 40 – 61 hr (LCMS control). Then, the mixture was allowed to cool to the room temperature and submitted to reverse phase HPLC to afford Formula 9.

Method B:

[3100] **Respective amine** (2.5 equiv) and triethylamine (2.0 equiv) were added to a stirred mixture of **11E** (1.0 equiv). The resulting mixture was stirred in sealed vial at 115 °C for 60 hr, then cooled down and poured in cold water (40 mL). The resulting mixture was allowed to stand for 0.5 hr. The resulting precipitate was filtered, washed with water (3*5 mL) and then dissolved in dichloromethane (30 mL). The solution was dried over sodium sulphate and concentrated *in vacuo*. The residue was dissolved in dry dichloromethane (10 mL) and Hydrogen chloride solution 4.0M in dioxane (60.0 equiv) was added in one portion. The resulting mixture was stirred at 25°C for 0.5 hr, and then evaporated to dryness in vacuo . The residue was submitted to reverse phase HPLC to afford Formula 9.

The resulting mixture was stirred at 80 °C for 2 hours following by the addition of tri-n-butyl phosphine (Bu_3P, 3.0 equiv.). The reaction mixture was stirred under reflux for 2 hours. Then, the volatiles were removed *in vacuo*. The residue was dissolved in DCM and washed with water. The organic layer separated, dried over Na_2SO_4 and concentrated under reduced pressure. The residue was purified by flash chromatography to afford **13B.**

The resulting mixture was evacuated and then backfilled with argon, this operation was repeated three times, then $Pd(dppf)_2Cl_2$ DCM (993.01 mg, 1.22 mmol) was added under argon. The reaction mixture was stirred under argon atmosphere at 90 °C for 14 hr. Then the mixture was allowed to cool to the room temperature and the volatiles were removed in vacuo to afford **13B**.

Step 2B: General procedure for 13I

[3183] **13H** (1.0 equiv.) was dissolved in a mixture of TFA (1.0 mL) and DCM (1.0 mL). The reaction mixture was stirred at room temperature for 30 minutes. Then, the mixture was

concentrated *in vacuo* to **13I**. The obtained material was used in the next step without an additional purification.

Step 1: Synthesis of 5-ethyl-2-phenyl-pyridine

[3402] To a stirred solution of 2-bromo-5-ethyl-pyridine (1 g, 5.37 mmol) and phenylboronic acid (655.36 mg, 5.37 mmol) in dioxane (10 mL) was added cesium carbonate (5.25 g, 16.12 mmol). The resulting suspension was degassed with argon.

Tetrakis(triphenylphosphine)palladium(0) (620 mg, 0.537 mmol) was added. The reaction mixture was stirred at 65 °C for overnight. Upon completion, the reaction mixture was filtered and the filtrate was evaporated in vacuo to obtain an oily residue. The residue was purified by reverse phase HPLC (49% water - acetonitrile; 0.5 - 6.5 min; flow rate: 30 mL/min; loading pump: 4 mL/min, acetonitrile; column: SunFire 100*19 mm, 5 um) to give product 5-ethyl-2-phenyl-pyridine (0.56 g, 3.06 mmol, 56.86% yield) as yellow oil.

Step 2: Synthesis of 5-ethyl-2-phenyl-piperidine

[3403] A solution of 5-ethyl-2-phenyl-pyridine (0.5 g, 2.73 mmol) in MeOH (20 mL) was hydrogenated over 5% $Pd(OH)_2$ on carbon (16.84 mg, 136.43 µmol) under 100 atm H_2 pressure at 50 °C for 18 hours. Upon completion, the reaction mixture was filtered, the residue was washed with MeOH (10 mL) and the filtrate was concentrated under reduced pressure to obtain 5-ethyl-2-phenyl-piperidine (0.38 g, 2.01 mmol, 73.57% yield). The crude product was used for the next step without any further purification.

Example 792. PRMT5 cooperativity assay

[3698] PRMT5 inhibitor potency and cooperativity in the absence and presence of cofactors SAM or MTA was assessed at equilibrium by measuring the dose dependent displacement of a fixed concentration of C-terminal 5'-TAMRA labeled peptide from Prmt5, utilizing fluorescent anisotropy as a signal. Two peptides were utilized for these studies:

Me0: Ac-SGRGKGGKGLGKGGAKRHRKV-K(5-TAMRA)–NH2.

Me2: Ac-SGR(Sym Me2)GKGGKGLGKGGAKRHRKV-K(5-TAMRA)–NH2

Data analysis

- Fluorescence polarization is normalized to calculate % inhibition.

$$\%\ \boldsymbol{inhibition - i} = \left(1 - \frac{i-P}{Prmt5_P-P}\right) * \mathbf{100} \qquad \text{Equation 1}$$

Where:

% inhibition is the percentage inhibition at a given concentration of inhibitor

i is the Fluorescent anisotropy at a given inhibitor concentration

P is the anisotropy signal given by the peptide alone and represents the minimum signal

Prmt5_P is the anisotropy signal given by the Prmt5 and peptide complex in the presence of DMSO, representing the maximum fluorescent anisotropy signal

- % inhibition data were fit with a 4-parameter logistic model. Bottom and Top were fixed to 0% and 100%, respectively. IC_{50} values are reported.
- The Ki can be calculated from the IC_{50} using the Cheng-Prussof equation:

$$IC_{50} = Ki \times \left(1 + \frac{[Peptide]}{Kd, Peptide}\right)$$

- For the assay performed in the presence of SAM, the Me2 peptide binding affinity to PRMT5 in the presence of SAM was determined to be 50 nM, and the peptide concentration is 25 nM, therefore $IC_{50} = Ki \times 1.5$
- For the assay performed in the presence of MTA, the Me0 peptide binding affinity to PRMT5 in the presence of MTA was determined to be 2 nM, and the peptide concentration is 25 nM, therefore $IC_{50} = Ki \times 13.5$

Example 793. Cellular assay – SDMA in-cell western protocol

[3700] A HAP1 *MTAP*-isogenic cell line pair was acquired from Horizon Discovery (HZGHC004894c005) and maintained in DMEM (ThermoFisher 11965) + 10% FBS (Gemini 100-500) in a humidified, 10% CO2 tissue culture incubator. The SAM-cooperative PRMT5 inhibitor, GSK3326595, was sourced from SelleckChem and maintained as a 10 mM DMSO stock. All test compounds are maintained as 10 mM DMSO stocks

[3701] On Day 0, *MTAP*-intact or *MTAP*-deleted cells are seeded in a 384-well plate, and incubated in a humidified, 5% CO2 tissue culture incubator for 16-24 hours. On Day 1, the test compounds are dispensed to wells at defined concentrations using a Tecan D300e digital dispenser (n=4), and the volume of DMSO is normalized to highest class volume. Each plate includes wells dosed with defined concentrations of GSK33226595 as a plate control. The compounds are incubated with cells for 24 hours in a humidified, 5% CO2 tissue culture incubator.

[3702] On Day 2, the compound-treated cells are fixed with a final concentration of 4% formaldehyde. The cells are then washed/permeabilized with 1X PBS + 0.1% Triton X-100, and then blocked with 5% goat serum/1X TBS. The fixed cells are then incubated overnight at 4°C with a primary SDMA antibody cocktail (Cell Signaling 13222).

[3703] On Day 3, the cells are washed with 1X PBS + 0.1% Triton X-100, and then incubated at room temperature for 1 hour with a NIR fluorescent secondary antibody cocktail that also contains DRAQ5 (LiCor 926-32211 and VWR 10761-508). The cells are washed with 1X PBS + 0.1% Triton X-100, and then washed again with ddH20. The plates are then imaged using a NIR fluorescent imager (LiCor Odyssey).

[3704] For data analysis, the SDMA signal is normalized to the DRAQ5 signal. Assay background is determined by the signal from wells treated with 1 μM GSK3326595, and subtracted from every well. The data are plotted as % of the DMSO control wells for the *MTAP*-intact and the *MTAP*-deleted cell lines independently, and fitted to the 4-parameter logistic (4-PL) Hill equation with maximal effect constrained to 0. The fit was performed using GraphPad Prism or the default IC50 fitting procedure in Dotmatics Studies 5.4 as part of a customized data analysis protocol.

[3705] The data obtained in this experiment is presented in Table 1, columns 7-9.

[3707] On Day 0, *MTAP*-intact and *MTAP*-deleted cells are seeded in a 96-well plate, and incubated in a humidified, 5 or 10% CO2 tissue culture incubator for 16-24 hours. On Day 1, the test compounds are dispensed to wells at defined concentrations using a Tecan D300e digital dispenser (n=3), and the volume of DMSO is normalized to highest class volume (0.2%). The compound-treated plates are incubated for 7 days in a humidified, 5 or 10% CO2 tissue culture incubator.

[3708] On Day 7, the plates are removed from the tissue culture incubator and allowed to equilibrate to room temperature. Then either a ½ volume CellTiter-Glo Luminescent Cell Viability Assay reagent (Promega G7572) is added to each well, or the media is removed from every well and a 1:3 dilution of CellTiter-Glo 2.0 Cell Viability Assay reagent (Promega G9241) in 1X PBS is added. Ten minutes after addition, the luminescent signal is detected by an Envision plate reader. The data are plotted as % of the DMSO control wells for the *MTAP*-intact and the *MTAP*-deleted cell lines independently, and fitted to the 4-parameter logistic (4-PL) Hill equation with maximal effect constrained to 0. The fit was performed using GraphPad Prism or the default IC50 fitting procedure in Dotmatics Studies 5.4 as part of a customized data analysis protocol.

[3709] The data obtained in this experiment is presented in Table 1, column 10.

Example 795. Combination viability assay protocol

[3710] A SW1573 *MTAP*-isogenic cell line pair was generated by either reconstituting MTAP gene expression, or by introducing an empty control vector, in the MTAP-deleted SW1573 parental cell line. The cell lines were maintained in DMEM + 10% FBS in a humidified, 5% CO2 tissue culture incubator. All test compounds are maintained as 10 mM DMSO stocks.

[3711] On Day 0, *MTAP*-intact and *MTAP*-deleted cells are seeded in a 384-well plate, and incubated in a humidified, 5% CO2 tissue culture incubator for 16-24 hours. On Day 1, the test compounds are dispensed to wells at defined concentrations (n=2), and the volume of DMSO is normalized to highest class volume. The compound-treated plates are incubated for 7 days in a humidified, 5% CO2 tissue culture incubator.

[3712] On Day 7, the plates are removed from the tissue culture incubator and allowed to equilibrate to room temperature. Relative viability is assessed by addition of CellTiter-Glo reagent, and data are plotted as % of DMSO control for each compound in each cell line, with a 4-parameter fit non-linear regression model (GraphPad Prism). Synergy is determined according to the HSA model by the Combenefit software package (Version 2.021).

PRMT5 inhibitors and MAT2A inhibitors represents a potential clinical combination in MTAP-deleted tumors

[3713] Marjon et al (Cell Reports 2016) and Kalev et al (Cancer Cell 2021) identify MAT2A as a therapeutic target in MTAP-deleted tumors. We assessed whether combination of a MAT2A inhibitor with an inhibitor that selectively targets PRMT5 in MTAP-null cells would present a rational therapeutic strategy. Combination of AG-270, a MAT2A inhibitor, with an exemplar $MTAP^{null}$-selective PRMT5 inhibitor in a 7-day viability assay in the MTAP-null SW1573 cancer cell line demonstrates enhanced cellular viability defects (FIG. 2).

[3714] This combination effect is synergistic according to the HSA model, where the synergy score quantifies the exess of the highest single compound response (FIG. 3).

PRMT5 inhibitors and MAPK or KRASG12C inhibitors represent a potential clinical combination in MTAP-deleted, KRAS-mutated tumors

[3715] MTAP-deletion can co-occur with mutations in the KRAS gene (eg, KRASG12C). Therapies targeting KRAS or other members of the MAPK pathway (eg, MAPK3, MAPK1, MEK1 and MEK2) exist. We assessed whether combination of these inhibitors with an inhibitor that selectively targets PRMT5 in MTAP-null cells would present a therapeutic strategy.

[3716] Combination of AMG-510, a KRASG12C inhibitor, with an exemplar $MTAP^{null}$-selective PRMT5 inhibitor in a 7-day viability assay in the MTAP-null SW1573 cancer cell line demonstrates enhanced cellular viability defects (FIG. 4).

[3717] Combination of MAPK1/MAPK3 inhibitors (exemplified by ulixertinib and SCH772984), with an exemplar $MTAP^{null}$-selective PRMT5 inhibitor in a 7-day viability assay in the MTAP-null SW1573 cancer cell line demonstrates enhanced cellular viability defects (FIG. 5).

[3718] Combination of MEK inhibitors (exemplified by trametinib), with an exemplar $MTAP^{null}$-selective PRMT5 inhibitor in a 7-day viability assay in the MTAP-null SW1573 cancer cell line demonstrates enhanced cellular viability defects (FIG. 6).

114. A method of treating a cancer in a subject in need thereof comprising the steps of:

a) assessing the level of MTAP and/or MTA in a test sample obtained from said subject, wherein the MTA level can be assessed directly (*e.g.*, by ELISA or LC-MS/MS) or indirectly (*e.g.*, by SDMA-modified protein ELISA or IHC, or by RNA splicing);

b) comparing the test sample with a reference, wherein MTAP deficiency and/or MTA accumulation in said test sample compared to the reference indicates the cancer in said subject will respond to therapeutic treatment with a PRMT5 inhibitor; and

c) administering a therapeutically effective amount of a compound of any one of claims 1 to 99 or composition of claim 100 or 101 to the subject identified in step b).
