PIPERIDIN-1 -YL-N-PYRYDI NE-3-YL-2-OXOACET AM IDE DERIVATIVES USEFUL FOR THE TREATMENT OF MTAP-DEFICIENT AND/OR MT A-ACCUMULATING CANCERS

Background of the Invention

[0001] Cancer therapeutics can be broadly classified into two categories, cytotoxic and targeted therapies. While cytotoxic therapies are associated with widespread toxicities, targeted therapies have the advantage of selectively targeting the tumor cells that rely on the activity of their substrates. The clinical efficacy of targeted therapies has been demonstrated with BCR/ABL and EGFR inhibitors for the treatment of CML and non-small cell lung cancer, respectively. The success of these programs has furthered development of other therapies that specifically target amplified or mutation-activated oncogenes. The greater challenge is to develop selective therapies that target those tumors with loss-of-function mutations or deletion of tumor suppressor genes, the loss of which obviate traditional strategies for molecular targeted therapeutics.

Efforts to characterize the cancer genome, led by groups like the Cancer Genome Atlas (TCGA), have made tremendous strides in elucidating the size and frequency of the deletion events that promote tumor growth by causing the loss of tumor suppressor genes. However, these events are often regional and cause the co-deletion of genes proximal to their intended targets. Though these passenger events are not known to cause a fitness advantage, they may cause collateral vulnerabilities that can be therapeutically leveraged. One example is the collateral vulnerability to PRMT5 inhibition conferred by loss of *methylthioadenosine phosphorylase (MTAP)*, which is frequently co-deleted with the well-described tumor suppressor gene, *CDKN2A* (Kruykov et al., 2016; Marjon et al., 2016 and Markarov et al., 2016).

[0002] Loss of *CDKN2A* occurs in ~10-15% of all human cancers and with frequency in histologies such as malignant peripheral nerve sheath tumors, glioblastoma, mesothelioma, bladder urothelial carcinoma, esophageal squamous cell carcinoma, pancreatic adenocarcinoma, melanoma, non-small cell lung cancer, head and neck cancer and cholangiosarcoma (Gao et al. *Sci. Signal.* 2013; Cerami et al. *Cancer Discov.* 2012; and Marjon et al. *Cell Reports* 2016). Because of its proximity to *CDKN2A* on chromosome 9p21, *MTAP* is frequently included in the deletion. MTAP is a critical enzyme in the methionine salvage pathway, a six-step process that recycles methionine from the product of polyamine synthesis, methylthioadenosine (MTA). Loss of MTAP causes the accumulation of its substrate, MTA, which has been demonstrated by multiple groups to function as a

SAM-competitive PRMT5 inhibitor (Kruykov et al., 2016; Marjon et al., 2016 and Markarov et al., 2016).

[0003] PRMT5 is a type II arginine methyltransferase that regulates essential cellular functions, including the regulation of cell cycle progression, apoptosis and the DNA-damage response, by symmetrically dimethylating proteins involved in transcription and signaling (Koh, Bezzi and Guccione *Curr Mol Bio Rep* 2015 and Wu et al *Nat Rev Drug Discovery* 2021). However, data from genome-wide genetic perturbation screens using shRNA has revealed a selective requirement for PRMT5 activity in *MTAP*-deleted cancer cell lines (Kruykov et al., 2016; Marjon et al., 2016 and Markarov et al., 2016). The accumulation of MTA caused by *MTAP*-deletion in these cell lines partially inhibits PRMT5, rendering those cells selectively sensitive to additional PRMT5 inhibition.

[0004] PRMT5 inhibitors have been developed, yet they do not demonstrate selectivity for MTAP-deleted cancer cell lines. This lack of selectivity can be explained by the mechanisms of action of the inhibitors, as they are either SAM-uncompetitive or SAM-competitive inhibitors and therefore, MTAP-agnostic (Kruykov et al., 2016; Marjon et al., 2016 and Markarov et al., 2016) However, if a PRMT5 inhibitor were developed that leverages the accumulation of MTA by binding in an MTA-uncompetitive, non-competitive or mixed mode manner or in a MTA-cooperative binding manner, it could demonstrate selectivity for MTAP-deleted tumor cells.

Definitions

MTAP

[0052] "MTAP" as used herein refers to methylthioadenosine phosphorylase, an enzyme in the methionine salvage pathway, also known as S-methyl-5'-thioadenosine phosphorylase; also known as BDMF; DMSFH; DMSMFH; LGMBF; MSAP; and c86fus. External IDs: OMIM: 156540 MGI: 1914152 HomoloGene:1838 chEMBL: 4941 GeneCards: MTAP Gene; Entrez 4507; RefSeq (mRNA): NM_002451; location: Chr 9: 21.8–21.93 Mb. By "wild-type" MTAP is meant that encoded by NM_002451 or having the same amino acid sequence (NP_002442). (Schmid et al. *Oncogene* 2000, 19, pp 5747-54).

As used herein, the term "MTAP-deficient","MTAP-deficiency","MTAP-null" and the like refer to cells (including, but not limited to, cancer cells, cell lines, tissues, tissue types, tumors, etc.) that have a significant reduction in post-translational modification, production, expression, level, stability and/or activity of MTAP relative to that in a control, *e.g.*, reference or normal or non-cancerous cells. The reduction can be at least about 20%, 30%, 40%, 50%, 60%, 70%, 80% or 90%. In some embodiments, the reduction is at least 20%. In some embodiments, the reduction is at least 50%. The terms "MTAP-deficient and/or MTA accumulating", "MTAP-deficient and/or MTA-accumulating", MTAP deficient and/or MTA upregulated" and the like, regarding a cell or cells, etc., indicate that the cell or cells, etc., either are deficient in MTAP and/or overproduce or accumulate MTA. MTAP-deficient cells include those wherein the MTAP gene has been mutated, deleted, or transcriptionally silenced. As a non-limiting example, MTAP-deficient cells can have a homozygous deletion. MTAP knockdown is not lethal. In some embodiments, the MTAP-deficient cells are also CDKN2A-deficient. The MTAP deficiency can be detected using any reagent or technique known in the art, for example: immunohistochemistry utilizing an antibody to MTAP, and/or genomic sequencing, and/or nucleic acid hybridization and/or amplification utilizing at least one probe or primer comprising a sequence of at least 12 contiguous nucleotides (nt) of the sequence of MTAP, wherein the primer is no longer than about 30 nt.

[0053] An "MTAP-deficiency-related" or "MTAP-deficiency" or "MTAP deficient" disease (for example, a proliferating disease, *e.g.*, a cancer) or a disease (for example, a proliferating disease, *e.g.*, a cancer)"associated with MTAP deficiency" or a disease (for example, a proliferating disease, *e.g.*, a cancer) "characterized by MTAP deficiency" and the like refer to an ailment (for example, a proliferating disease, *e.g.*, a cancer) wherein a significant number of cells are MTAP-deficient. For example, in a MTAP-deficiency-related disease, one or more disease cells can have a significantly reduced post-translational modification, production, expression, level, stability and/or activity of MTAP. Examples of MTAP-deficiency-related diseases include, but are not limited to, cancers, including but not limited to: glioblastoma, malignant peripheral nerve sheath tumors (MPNST), esophageal cancer (*e.g.*, esophageal squamous cell carcinoma or esophageal adenocarcinoma), bladder cancer (*e.g.*, bladder urothelial carcinoma), pancreatic cancer (*e.g.*, pancreatic adenocarcinoma), mesothelioma, melanoma, non-small cell lung cancer (NSCLC; *e.g.*, lung squamous or lung adenocarcinoma), astrocytoma, undifferentiated pleiomorphic sarcoma, diffuse large B-cell lymphoma (DLBCL), leukemia, head and neck cancer, stomach

adenocarcinoma, myxofibrosarcoma, cholangiosarcoma, cancer of the brain, stomach, kidney, breast, endometrium, urinary tract, liver, soft tissue, pleura and large intestine or sarcoma (See FIG. 1). In a patient afflicted with a MTAP-deficiency-related disease, it is possible that some disease cells (*e.g.*, cancer cells) can be MTAP-deficient while others are not. Similarly, some disease cells may be MTA-accumulating while others are not. Thus, the present disclosure encompasses methods of treatment involving diseases of these tissues, or any other tissues, wherein the proliferation of MTAP-deficient and/or MTA-accumulating cells can be inhibited by administration of a PRMT5 inhibitor.
Some cancer cells which are MTAP-deficient are also deficient in CDKN2A; the post-translational modification, production, expression, level, stability and/or activity of the CDKN2A gene or its product are decreased in these cells. The genes for MTAP and CDKN2A are in close proximity on chromosome 9p21; MTAP is located approximately 100 kb telomeric to CDKN2A. Many cancer cell types harbor CDKN2A/MTAP loss (loss of both genes). Thus, in some embodiments, a MTAP-deficient cell is also deficient in CDKN2A.

MTA and MTA accumulation

[0054] By "MTA" is meant the PRMT5 inhibitor also known as methyl-thioadenosine, S-methyl-5`-thioadenosine, [5'deoxy-5'-(methylthio)-fl-D-ribofuranosyl] adenine, 5'-methyl-thioadenosine, 5′-deoxy, 5′-methyl thioadenosine, and the like. MTA selectively inhibits PRMT5 methyltransferase activity. MTA is the sole known catabolic substrate for MTAP. The terms "MTA accumulating", "MTA overproducing", "MTA upregulated" and the like refer to cells (including, but not limited to, cancer cells, cell lines, tissues, tissue types, tumors, etc.) that have a significantly increased production, level and/or stability of MTA. MTA-accumulating cells include those wherein the cells comprise at least about 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 100%, or greater than 100%, higher production, level and/or stability of MTA than that in normal or non-cancerous cells. In some embodiments, MTA-accumulating cells include those wherein the cells comprise at least 20% higher production, level and/or stability of MTA than that in normal or non-cancerous cells. In some embodiments, MTA-accumulating cells include those wherein the cells comprise at least 50% higher production, level and/or stability of MTA than that in normal or non-cancerous cells. Determination of MTA accumulation in test samples (*e.g.*, cells such as cancer cells being tested for MTA accumulation) and reference samples, and other cells,

tissues, samples, etc., can be performed using any method known in the art. Such methods for detecting MTA include, as a non-limiting example, liquid chromatography–electrospray ionization–tandem mass spectrometry (LC-ESI-MS/MS), as described in Stevens et al. *J. Chromatogr. A.* 2010, 1217, pp 3282-3288; and Kirovski et al. *Am. J. Pathol.* 2011, 178, pp 1145-1152; and references cited therein. Loss of MTAP is associated with accumulation of MTA (Williams-Ashman et al. *Biochem. Pharm.* 1982, 31, pp 277-288; and Limm et al. *Eur. J. Cancer.* 2013, 49, Issue 6.

[0055] An "MTA-accumulation-related", "MTA-accumulation", "MTA-accumulating", "MTA overproducing", "MTA upregulated" disease (for example, a proliferating disease, *e.g.*, a cancer) or a disease (for example, a proliferating disease, *e.g.*, a cancer) "associated with MTA accumulation" or a disease (for example, a proliferating disease, *e.g.*, a cancer) "characterized by MTA accumulation" and the like refer to an ailment (for example, a proliferating disease, *e.g.*, a cancer) wherein a significant number of cells are MTA accumulating. Examples of MTA-accumulating diseases include, but are not limited to, cancers, including but not limited to: glioblastoma, malignant peripheral nerve sheath tumors (MPNST), esophageal cancer (*e.g.*, esophageal squamous cell carcinoma or esophageal adenocarcinoma), bladder cancer (*e.g.*, bladder urothelial carcinoma), pancreatic cancer (*e.g.*, pancreatic adenocarcinoma), mesothelioma, melanoma, non-small cell lung cancer (NSCLC; *e.g.*, lung squamous or lung adenocarcinoma), astrocytoma, undifferentiated pleiomorphic sarcoma, diffuse large B-cell lymphoma (DLBCL), leukemia, head and neck cancer, stomach adenocarcinoma, myxofibrosarcoma, cholangiosarcoma, cancer of the brain, stomach, kidney, breast, endometrium, urinary tract, liver, soft tissue, pleura and large intestine or sarcoma (See FIG. 1). In a patient afflicted with a MTAP-deficiency-related disease, it is possible that some disease cells (*e.g.*, cancer cells) can be MTAP-deficient while others are not.

In a patient having or having been diagnosed with an MTA-accumulating disease, some cells may be MTA-accumulating while others are not.

[0056] Anincrease in therapeutic window between normal cells and MTAP-deleted/MTA accumulating cells could be achieved by using an inhibitor that binds PRMT5 uncompetitively with MTA. As used herein, "uncompetitive binding" and "uncompetitive inhibition" and "cooperative binding" and "cooperative inhibition" (*e.g.*, MTA-uncompetitive binding, MTA-uncompetitive inhibition, MTA-cooperative binding, MTA-cooperative inhibition) refers to binding of an inhibitor to a protein (*e.g.*, PRMT5) that is increased in the

presence of a co-factor (*e.g.*, MTA) over the binding of the same inhibitor in the absence of the co-factor. The PRMT5 inhibitors known in the art are generally either SAM (S-adenosylmethionine) uncompetitive or SAM competitive. As the concentration of SAM in wild-type and MTAP-null cells is similar, these inhibitors are expected to bind with similar potency to both cell types. By contrast, an MTA-cooperative (and either SAM competitive or showing enhanced cooperativity with MTA relative to SAM) inhibitor would bind with apparent greater potency in the presence of high concentrations of MTA and would therefore result in preferential inhibition of PRMT5 in MTA-accumulating cells relative to normal cells.

[0057] As described further herein, a cancer cell, a cancer type, or a subject with cancer, is "PRMT5 inhibitor sensitive," sensitive to treatment with PRMT5 inhibitors," sensitive to PRMT5 therapeutic inhibition," or described in similar terms if it is amenable to treatment with a PRMT5 inhibitor, *e.g.*, due to its MTAP deficiency and/or MTA accumulation character.

PRMT5

[0058] "PRMT5" as used herein is the gene or protein Protein Arginine Methyltransferase 5, also known as HRMT1L5; IBP72; JBP1; SKB1; or SKB1Hs External IDs: OMIM: 604045, MGI: 1351645, HomoloGene: 4454, ChEMBL: 1795116, GeneCards: PRMT5 Gene; EC number 2.1.1.125. Ensembl ENSG00000100462; UniProt O14744; Entrez Gene ID: 10419; RefSeq (mRNA): NM_001039619. The mouse homolog is NM_013768. Methyltransferases such as PRMT5 catalyze the transfer of one to three methyl groups from the co-factor S-adenosylmethionine (also known as SAM or AdoMet) to lysine or arginine residues of histone proteins. Arginine methylation is carried out by 9 different protein arginine methyltransferases (PRMT) in humans. Three types of methylarginine species exist: (1) Monomethylarginine (MMA); (2) Asymmetric dimethyl arginine (ADMA), which is produced by Type I methyl transferases (PRMT1, PRMT2, PRMT3, CARM1, PRMT6 and PRMT8); and (3) Symmetrical dimethylarginine (SDMA), which is produced by Type II methyl transferases (PRMT5 and PRMT7). PRMT1 and PRMT5 are the major asymmetric and symmetric arginine methyltransferases, respectively. PRMT5 promotes symmetric dimethylation on histones at H3R8 and H4R3 (H4R3me2). Symmetric methylation of H4R3 is associated with transcriptional repression and can act as a binding site for DNMT3A. Loss of PRMT5 results in reduced DNMT3A binding and gene activation. Tumor suppressor gene

ST7 and chemokines RNATES, IP10, CXCL11 are targeted and silenced by PRMT5. WO 2011/079236.

[0059] Additional substrates include E2F1, p53, EGFR and CRAF. PRMT5 is part of a multi-protein complex comprising the co-regulatory factor WDR77 (also known as MEP50, a CDK4 substrate) during G1/S transition. Phosphorylation increases PRMT5/WDR77 activity. WDR77 is the non-catalytic component of the complex and mediates interactions with binding partners and substrates. PRMT5 can also interact with pICln or RioK1 adaptor proteins in a mutually exclusive fashion to modulate complex composition and substrate specificity.

[0060] PRMT5 has either a positive or negative effect on its substrates by arginine methylation when interacting with a number of complexes and is involved in a variety of cellular processes, including RNA processing, signal transduction, transcriptional regulation, and germ cell development. PRMT5 is a major pro-survival factor regulating eIF4E expression and p53 translation. PRMT5 triggers p53-dependent apoptosis and sensitized various cancer cells to Tumor necrosis factor (TNF)-related apoptosis-inducing ligand (TRAIL) without affecting TRAIL resistance in non-transformed cells.

[0061] The term "PRMT5 inhibitor" refers to any compound capable of inhibiting the production, level, activity, expression or presence of PRMT5. These include, as non-limiting examples, any compound inhibiting the transcription of the gene, the maturation of RNA, the translation of mRNA, the posttranslational modification of the protein, the enzymatic activity of the protein, the interaction of same with a substrate, etc. The term also refers to any agent that inhibits the cellular function of the PRMT5 protein, either by ATP-competitive inhibition of the active site, allosteric modulation of the protein structure, disruption of protein-protein interactions, or by inhibiting the transcription, translation, post-translational modification, or stability of PRMT5 protein.

[0062] In some embodiments, a PRMT5 inhibitor competes with another compound, protein or other molecule which interacts with PRMT5 and is necessary for PRMT5 function. As a non-limiting example, a PRMT5 inhibitor can compete with the co-factor S-adenosylmethionine (also known as SAM or AdoMet).

In some embodiments, the PRMT5 inhibitor is uncompetitive with MTA. In further embodiments, the PRMT5 inhibitor is uncompetitive with MTA and competitive with SAM.

In some embodiments, the PRMT5 inhibitor is uncompetitive with MTA and uncompetitive with SAM but binds with a higher degree of potency for the MTA complex relative to the SAM complex.

Chemical Definitions

[0063] Definitions of specific functional groups and chemical terms are described in more detail below. The chemical elements are identified in accordance with the Periodic Table of the Elements, CAS version, *Handbook of Chemistry and Physics*, 75th Ed., inside cover, and specific functional groups are generally defined as described therein. Additionally, general principles of organic chemistry, as well as specific functional moieties and reactivity, are described in Thomas Sorrell, *Organic Chemistry*, University Science Books, Sausalito, 1999; Smith and March, *March's Advanced Organic Chemistry*, 5th Edition, John Wiley & Sons, Inc., New York, 2001; Larock, *Comprehensive Organic Transformations*, VCH Publishers, Inc., New York, 1989; and Carruthers, *Some Modern Methods of Organic Synthesis*, 3rd Edition, Cambridge University Press, Cambridge, 1987.

[0064] Compounds described herein can comprise one or more asymmetric centers, and thus can exist in various isomeric forms, *e.g.*, enantiomers and/or diastereomers. For example, the compounds described herein can be in the form of an individual enantiomer, diastereomer or geometric isomer, or can be in the form of a mixture of stereoisomers, including racemic mixtures and mixtures enriched in one or more stereoisomer. Isomers can be isolated from mixtures by methods known to those skilled in the art, including chiral high-pressure liquid chromatography (HPLC) and the formation and crystallization of chiral salts; or preferred isomers can be prepared by asymmetric syntheses. See, for example, Jacques *et al.*, *Enantiomers, Racemates and Resolutions* (Wiley Interscience, New York, 1981); Wilen *et al.*, *Tetrahedron* 33:2725 (1977); Eliel, *Stereochemistry of Carbon Compounds* (McGraw–Hill, NY, 1962); and Wilen, *Tables of Resolving Agents and Optical Resolutions* p. 268 (E.L. Eliel, Ed., Univ. of Notre Dame Press, Notre Dame, IN 1972). The invention additionally encompasses compounds described herein as individual isomers substantially free of other isomers, and alternatively, as mixtures of various isomers.

[0065] The "enantiomeric excess" ("e.e.") or "% enantiomeric excess" ("%e.e.") of a composition as used herein refers to an excess of one enantiomer relative to the other enantiomer present in the composition. For example, a composition can contain 90% of one enantiomer, *e.g.*, the S enantiomer, and 10% of the other enantiomer, *i.e.*, the R enantiomer.

e.e. = (90-10)/100 = 80%.

[0066] Thus, a composition containing 90% of one enantiomer and 10% of the other enantiomer is said to have an enantiomeric excess of 80%.

[0067] The "diastereomeric excess" ("d.e.") or "% diastereomeric excess" ("%d.e.") of a composition as used herein refers to an excess of one diastereomer relative to one or more different diastereomers present in the composition. For example, a composition can contain 90% of one diastereomer, and 10% of one or more different diastereomers.

d.e. = (90-10)/100 = 80%.

[0068] Thus, a composition containing 90% of one diastereomers and 10% of one or more different diastereomers is said to have a diastereomeric excess of 80%.

In an alternative embodiment, compounds described herein may also comprise one or more isotopic substitutions. For example, hydrogen may be ^{2}H (D or deuterium) or ^{3}H (T or tritium); carbon may be, for example, ^{13}C or ^{14}C; oxygen may be, for example, ^{18}O; nitrogen may be, for example, ^{15}N, and the like. In other embodiments, a particular isotope (*e.g.*, ^{3}H, ^{13}C, ^{14}C, ^{18}O, or ^{15}N) can represent at least 1%, at least 5%, at least 10%, at least 15%, at least 20%, at least 25%, at least 30%, at least 35%, at least 40%, at least 45%, at least 50%, at least 60%, at least 65%, at least 70%, at least 75%, at least 80%, at least 85%, at least 90%, at least 95%, at least 99%, or at least 99.9% of the total isotopic abundance of an element that occupies a specific site of the compound.

[0123] As used herein, the term "salt" refers to any and all salts and encompasses pharmaceutically acceptable salts.

[0124] The term "pharmaceutically acceptable salt" refers to those salts which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically acceptable salts are well known in the art. For example, Berge *et al.*, describes pharmaceutically acceptable salts in detail in *J. Pharmaceutical Sciences* (1977) 66:1–19. Pharmaceutically acceptable salts of the compounds of this invention include those derived from suitable inorganic and organic acids and bases. Examples of pharmaceutically acceptable, nontoxic acid addition salts are salts of an amino group formed with inorganic acids such as hydrochloric acid, hydrobromic acid, phosphoric acid, sulfuric acid and perchloric acid or with organic acids such as acetic acid, oxalic acid, maleic acid, tartaric acid, citric acid, succinic acid or malonic acid or by using other methods used in the art such as ion exchange. Other pharmaceutically acceptable salts include adipate, alginate, ascorbate, aspartate, benzenesulfonate, benzoate, bisulfate, borate, butyrate, camphorate, camphorsulfonate, citrate, cyclopentanepropionate, digluconate, dodecylsulfate, ethanesulfonate, formate, fumarate, glucoheptonate, glycerophosphate, gluconate, hemisulfate, heptanoate, hexanoate, hydroiodide, 2–hydroxy–ethanesulfonate, lactobionate, lactate, laurate, lauryl sulfate, malate, maleate, malonate, methanesulfonate, 2–naphthalenesulfonate, nicotinate, nitrate, oleate, oxalate, palmitate, pamoate, pectinate, persulfate, 3–phenylpropionate, phosphate, picrate, pivalate, propionate, stearate, succinate, sulfate, tartrate, thiocyanate, p–toluenesulfonate, undecanoate, valerate salts, and the like. Pharmaceutically acceptable salts derived from appropriate bases include alkali metal, alkaline earth metal, ammonium and $N^+(C_{1-4}alkyl)_4$ salts. Representative alkali or alkaline earth metal salts include sodium, lithium, potassium, calcium, magnesium, and the like.

Further pharmaceutically acceptable salts include, when appropriate, nontoxic ammonium, quaternary ammonium, and amine cations formed using counterions such as halide, hydroxide, carboxylate, sulfate, phosphate, nitrate, lower alkyl sulfonate, and aryl sulfonate.

[0125] A "subject" to which administration is contemplated includes, but is not limited to, humans (*i.e.*, a male or female of any age group, *e.g.*, a pediatric subject (*e.g.*, infant, child, adolescent) or adult subject (*e.g.*, young adult, middle-aged adult or senior adult)) and/or a non-human animal, *e.g.*, a mammal such as primates (*e.g.*, cynomologus monkeys, rhesus monkeys), cattle, pigs, horses, sheep, goats, rodents, cats, and/or dogs. In certain embodiments, the subject is a human. In certain embodiments, the subject is a non-human animal. The terms "human," "patient," and "subject" are used interchangeably herein.

[0126] Disease, disorder, and condition are used interchangeably herein.

[0127] As used herein, and unless otherwise specified, the terms "treat," "treating" and "treatment" contemplate an action that occurs while a subject is suffering from the specified disease, disorder or condition, which reduces the severity of the disease, disorder or condition, or retards or slows the progression of the disease, disorder or condition ("therapeutic treatment"), and also contemplates an action that occurs before a subject begins to suffer from the specified disease, disorder or condition ("prophylactic treatment").

[0128] In general, the "effective amount" of a compound refers to an amount sufficient to elicit the desired biological response. As will be appreciated by those of ordinary skill in this art, the effective amount of a compound of the invention may vary depending on such factors as the desired biological endpoint, the pharmacokinetics of the compound, the disease being treated, the mode of administration, and the age, health, and condition of the subject. An effective amount encompasses therapeutic and prophylactic treatment.

[0129] As used herein, and unless otherwise specified, a "therapeutically effective amount" of a compound is an amount sufficient to provide a therapeutic benefit in the treatment of a disease, disorder or condition, or to delay or minimize one or more symptoms associated with the disease, disorder or condition. A therapeutically effective amount of a compound means an amount of therapeutic agent, alone or in combination with other therapies, which provides a therapeutic benefit in the treatment of the disease, disorder or condition. The term "therapeutically effective amount" can encompass an amount that improves overall therapy, reduces or avoids symptoms or causes of disease or condition, or enhances the therapeutic efficacy of another therapeutic agent.

[0130] As used herein, and unless otherwise specified, a "prophylactically effective amount" of a compound is an amount sufficient to prevent a disease, disorder or condition, or one or more symptoms associated with the disease, disorder or condition, or prevent its recurrence. A prophylactically effective amount of a compound means an amount of a therapeutic agent, alone or in combination with other agents, which provides a prophylactic benefit in the prevention of the disease, disorder or condition. The term "prophylactically effective amount" can encompass an amount that improves overall prophylaxis or enhances the prophylactic efficacy of another prophylactic agent.

[0370] In one embodiment, the invention provides a compound selected from the compounds of Table 1, or pharmaceutically acceptable salts thereof.

[0371] Compounds described herein (*e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) are useful as inhibitors of PRMT5 (*e.g.*, MTA uncompetitive PRMT5 inhibitors).

[0372] Table 1 indicates IC_{50} values (μM) against PRMT5 for exemplary compounds in the presence of SAM as cofactor, with no cofactor, and with MTA as cofactor, respectively (columns 4-6). For Table 1, "a" "aa", and "aaa" indicates an IC_{50} less than 50 nM in the assays with SAM, no cofactor, and MTA respectively; "b", "bb", and "bbb" indicates an IC_{50} of 50 nM to less than 500 nM in the assays with SAM, no cofactor, and MTA, respectively; "c", "cc", and "ccc" indicates an IC_{50} of greater than or equal to 500 nM in the assays with SAM, no cofactor, and MTA, respectively. Ki values can be calculated from the IC_{50} values as described in the Examples section. As detailed in the Examples section, for the assay performed in the presence of SAM, $IC_{50} = Ki \times 1.5$ (Ki=IC_{50}/1.5). For the assay performed in the presence of MTA, $IC_{50} = Ki \times 13.5$ (Ki=IC_{50}/13.5).

[0373] Table 1 also indicates IC_{50} values in an MTAP-isogenic cell line pair for exemplary compounds in an SDMA in-cell western assay (columns 7-8). HAP1 MTAP-intact is a cell line in which endogenous levels of MTAP are expressed, and HAP1 MTAP-deleted is an MTAP-null cell line. For Table 1, "a*" and "aa*" indicates an IC_{50} of < 100 nM, "b*" and "bb*" indicates an IC_{50} equal to or greater than 100 nM but less than 1 μM, and "c*" and "cc*"indicates an IC_{50} of greater than or equal to 1 μM in the HAP1 MTAP-intact and the HAP1 MTAP-deleted assays, respectively. In column 9, "A" indicates an IC_{50} ratio greater than or equal to 10 fold between the IC_{50} in the HAP1 MTAP-intact cell line and the HAP1 MTAP-deleted cell line; "B" indicates an IC_{50} ratio greater than or equal to 3 fold but lower than 10 fold between the IC_{50} in the HAP1 MTAP-intact cell line and the HAP1 MTAP-deleted cell line; "C" indicates an IC_{50} ratio of less than 3 fold between the IC_{50} in the HAP1 MTAP-intact cell line and the HAP1 MTAP-deleted cell line. Compounds with a ratio in the SDMA in-cell western assay of equal to or greater than 3 fold are considered MTAP-selective.

[0374] Table 1 additionally indicates IC_{50} values in a viability assay for the MTAP-deleted cell line (column 10), indicating the effect of treatment with compound on cell survival. In column 10, a value of A^* indicates an IC_{50} of less than 1 μM, a value of B^* indicates an IC_{50} equal to or greater than 1 μM but less than 10 μM, and a value of C^* indicates an IC_{50} greater than or equal to 10 μM.

[0375] Unless otherwise indicated, the absolute stereochemistry of all chiral atoms is as depicted. Compounds marked with (*or*) or (*rel*) are single enantiomers wherein the absolute stereochemistry was arbitrarily assigned (*e.g.*, based on chiral SFC elution as described in the Examples section). Compounds marked with (*and*) or (*rac*) are mixtures of enantiomers wherein the relative stereochemistry is as shown. Compounds marked with (*abs*) are single enantiomers wherein the absolute sterochemistry is as indicated.

[0377] As shown in Scheme 1, compounds of Formula (Ia), (Ib), (Ic), and (Id) can be separated from a mixture of compounds of Formula (I), wherein R^1, R^2, R^3, R^4, R^6, R^7, R^8, and n are as described herein, R^{1a} is selected from R^1 and -NH-PG and R^{2a} is selected from R^2 and -NH-PG, wherein PG is a nitrogen protecting group as defined herein (*e.g.*, -Boc). In certain embodiments (*e.g.*, when R^{1a} is NH-PG and R^1 is $-NH_2$ or R^{2a} is NH-PG and R^2 is $-NH_2$), a deprotection step is employed to convert R^{1a} to R^1 or R^{2a} to R^2. A deprotection step can take place before or after a separation step. Conditions for removing a protecting group -PG (*e.g.*, -Boc) can employ, for example, acidic conditions, (*e.g.*, water/dioxane, hydrochoric acid in a protic solvent (*e.g.*, methanol), hydrochloric acid in an aprotic solvent (*e.g.*, dioxane), TFA in an an aprotic solvent (*e.g.*, dichoromethane, chloroform, etc)).

[0378] Compounds of Formula (I) can be prepared by subjecting compounds of formula I-6 to amide bond coupling conditions. In some embodiments, compounds of formula (I) are prepared through amide bond coupling of a compound of formula I-6 with a compound of formula I-7. Examples of conditions known to generate a compound of formula I from a compound of formula I-6 and formula I-7 include but are not limited to adding a coupling agent such as CDI, HATU, HOBT, HBTU or PyBOP, a base such as a hydride base *e.g.*, NaH, or KH, an amine base such as DBU, NEt_3, and $NEt(^iPr)_2$ or a carbonate base *e.g.*, Na_2CO_3, K_2CO_3, or Cs_2CO_3, and in one embodiment stirring a reaction at 0 °C to room temperature or another embodiment at a temperature of 70 °C or higher, for example at a temperature in a range of 70 °C to 110 °C, or in a range of 70 °C to 80 °C, or at 80 °C. A reaction may be carried out in solvents such as but not limited to DMF, and MTBE. In some embodiments, a compound of formula (I) is prepared through amide bond coupling of a compound of formula I-6 with a compound of formula I-8. Examples of conditions known to generate a compound of formula I from a compound of formula I-6 and formula I-8 include but are not limited to adding a base such as an organolithium base, *e.g.*, *n*-BuLi, *t*-BuLi, lithium diisopropylamide (LDA), lithium bis(trimethylsilyl)amide (LiHMDS), a hydride base *e.g.*, NaH, or KH, an amine base such as DBU, NEt_3, and $NEt(^iPr)_2$ or a carbonate base *e.g.*, Na_2CO_3, K_2CO_3, or Cs_2CO_3, and in one embodiment stirring a reaction at 0 °C to room temperature or another embodiment at a temperature of 70 °C or higher, for example at a temperature in a range of 70 °C to 110 °C, or in a range of 70 °C to 80 °C, or at 80 °C. A reaction may be carried out in solvents such as but not limited to THF, Et_2O, TMEDA, DME and MTBE or mixtures thereof.

[0379] In some embodiments, a compound of formula I-5 undergoes a sequence of deprotection, cyclization and reduction to prepare a compound of formula I-6. Conditions for the removal of a protecting group (PG), *e.g.*, MoM or Boc are known to a person of ordinary skill in the art. For example, Boc deprotection may comprise treatment with an acid. Exemplary acids include TFA, and HCl, and exemplary solvents include protic solvents such as methanol, halogenated solvents such as DCM and hexafluoroisopropanol or ether solvents such as dioxane and dimethylether. In some embodiments, upon deprotection of a compound of formula I-5 can undergo spontaneous cyclization to form a cyclic imine. Reduction of a cyclic imine can be accomplished using a reducing agent such as a hydride reducing agent, *e.g.*, $NaBH_4$, or $LiAlH_4$, silicon reducing agent, *e.g.*, Cl_3SiH, or H_2 reduction in the presence of a catalyst, *e.g.* a Ir catalyst, a Ru catalyst, a Pd catalyst (*e.g.*, Pd/C, $Pd(OAc)_2$).

[0380] A compound of formula I-5 can be prepared by nucleophilic addition to a compound of formula I-4. Nucleophilic addition can be accomplished using a Grignard reagent, *e.g.* R^6MgBr. A nucleophilic addition reaction may be carried out in solvents such as but not limited to THF, Et_2O, TMEDA, DME and MTBE or mixtures thereof.

[0381] Alternatively, a compound of formula I-6 can be prepared via a reduction of a compound of formula I-3. Reduction of a compound of formula I-3 can be accomplished using a reducing agent such as a hydride reducing agent, *e.g.*, $NaBH_4$, or $LiAlH_4$, silicon reducing agent, *e.g.*, Cl_3SiH, or H_2 reduction in the presence of a catalyst, *e.g.* a Ir catalyst, a Ru catalyst, a Pd catalyst (*e.g.*, Pd/C, $Pd(OAc)_2$).

[0382] In some embodiments, a compound of formula I-2 can undergo deprotection/double bond migration, to afford a compound of formula I-3. Conditions for the removal of a protecting group (PG), *e.g.*, MoM or Boc are known to a person of ordinary skill in the art. For example, Boc deprotection may comprise treatment with an acid. Exemplary acids include TFA, and HCl, and exemplary solvents include protic solvents such as methanol, halogenated solvents such as DCM and hexafluoroisopropanol or ether solvents such as dioxane and dimethylether.

[0383] In some embodiments, a compound of I-2 can be prepared through the cross-coupling of a compound of formula I-1 (wherein X is a leaving group, *e.g.*, a halogen or -OSO_2CF_3) with a suitable cross-coupling partner. In some embodiments, a suitable cross-coupling partner includes, but is not limited to, a boron-containing cross-coupling partner, *e.g.*, $R^6B(OH)_2$, or R^6Bpin.

[0393] Generally, the compounds provided herein are administered in a therapeutically effective amount. The amount of the compound actually administered will typically be determined by a physician, in the light of the relevant circumstances, including the condition to be treated, the chosen route of administration, the actual compound administered, the age, weight, and response of the individual patient, the severity of the patient's symptoms, and the like.

[0394] The pharmaceutical compositions provided herewith may be administered orally, parenterally, by inhalation spray, topically, rectally, nasally, buccally, vaginally or via an implanted reservoir, preferably by oral administration or administration by injection. The pharmaceutical compositions provided herewith may contain any conventional nontoxic pharmaceutically acceptable carriers, adjuvants or vehicles. In some cases, the pH of the formulation may be adjusted with pharmaceutically acceptable acids, bases or buffers to enhance the stability of the formulated compound or its delivery form. The term parenteral as

used herein includes subcutaneous, intracutaneous, intravenous, intramuscular, intraarticular, intraarterial, intrasynovial, intrasternal, intrathecal, intralesional and intracranial injection or infusion techniques.

[0395] The compositions for oral administration can take the form of bulk liquid solutions or suspensions, or bulk powders. More commonly, however, the compositions are presented in unit dosage forms to facilitate accurate dosing. The term "unit dosage forms" refers to physically discrete units suitable as unitary dosages for human subjects and other mammals, each unit containing a predetermined quantity of active material calculated to produce the desired therapeutic effect, in association with a suitable pharmaceutical excipient. Typical unit dosage forms include prefilled, premeasured ampules or syringes of the liquid compositions or pills, tablets, capsules or the like in the case of solid compositions. In such compositions, the compound is usually a minor component (from about 0.1 to about 50% by weight or preferably from about 1 to about 40% by weight) with the remainder being various vehicles or carriers and processing aids helpful for forming the desired dosing form.

[0396] Liquid forms suitable for oral administration may include a suitable aqueous or nonaqueous vehicle with buffers, suspending and dispensing agents, colorants, flavors and the like. Solid forms may include, for example, any of the following ingredients, or compounds of a similar nature: a binder such as microcrystalline cellulose, gum tragacanth or gelatin; an excipient such as starch or lactose, a disintegrating agent such as alginic acid, Primogel, or corn starch; a lubricant such as magnesium stearate; a glidant such as colloidal silicon dioxide; a sweetening agent such as sucrose or saccharin; or a flavoring agent such as peppermint, methyl salicylate, or orange flavoring.

[0397] Injectable compositions are typically based upon injectable sterile saline or phosphate-buffered saline or other injectable carriers known in the art. As before, the active compound in such compositions is typically a minor component, often being from about 0.05 to 10% by weight with the remainder being the injectable carrier and the like. The pharmaceutical compositions may be in the form of a sterile injectable preparation, for example, as a sterile injectable aqueous or oleaginous suspension. This suspension may be formulated according to techniques known in the art using suitable dispersing or wetting agents (such as, for example, Tween 80) and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent, for example, as a solution in 1,3–butanediol. Among the acceptable vehicles and solvents that may be employed are mannitol, water, Ringer's solution

and isotonic sodium chloride solution. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose, any bland fixed oil may be employed including synthetic mono-- or diglycerides. Fatty acids, such as oleic acid and its glyceride derivatives are useful in the preparation of injectables, as are natural pharmaceutically acceptable oils, such as olive oil or castor oil, especially in their polyoxyethylated versions. These oil solutions or suspensions may also contain a long chain alcohol diluent or dispersant, or carboxymethyl cellulose or similar dispersing agents which are commonly used in the formulation of pharmaceutically acceptable dosage forms such as emulsions and or suspensions. Other commonly used surfactants such as Tweens or Spans and/or other similar emulsifying agents or bioavailability enhancers which are commonly used in the manufacture of pharmaceutically acceptable solid, liquid, or other dosage forms may also be used for the purposes of formulation.

[0398] Transdermal compositions are typically formulated as a topical ointment or cream containing the active ingredient(s), generally in an amount ranging from about 0.01 to about 20% by weight, preferably from about 0.1 to about 20% by weight, preferably from about 0.1 to about 10% by weight, and more preferably from about 0.5 to about 15% by weight. When formulated as an ointment, the active ingredients will typically be combined with either a paraffinic or a water-miscible ointment base. Alternatively, the active ingredients may be formulated in a cream with, for example an oil-in-water cream base. Such transdermal formulations are well-known in the art and generally include additional ingredients to enhance the dermal penetration of stability of the active ingredients or the formulation. All such known transdermal formulations and ingredients are included within the scope provided herein.

[0399] The compounds provided herein can also be administered by a transdermal device. Accordingly, transdermal administration can be accomplished using a patch either of the reservoir or porous membrane type, or of a solid matrix variety.

[0400] The pharmaceutical compositions provided herewith may also be administered in the form of suppositories for rectal administration. These compositions can be prepared by mixing a compound provided herewith with a suitable non irritating excipient which is solid at room temperature but liquid at the rectal temperature and therefore will melt in the rectum to release the active components. Such materials include, but are not limited to, cocoa butter, beeswax and polyethylene glycols.

[0401] The pharmaceutical compositions provided herewith may be administered by nasal aerosol or inhalation. Such compositions are prepared according to techniques well known in the art of pharmaceutical formulation and may be prepared as solutions in saline, employing benzyl alcohol or other suitable preservatives, absorption promoters to enhance bioavailability, fluorocarbons, and/or other solubilizing or dispersing agents known in the art.

[0402] The above-described components for orally administrable, injectable or topically administrable, rectally administrable and nasally administrable compositions are merely representative. Other materials as well as processing techniques and the like are set forth in Part 8 of *Remington's Pharmaceutical Sciences*, 17th edition, 1985, Mack Publishing Company, Easton, Pennsylvania, which is incorporated herein by reference.

[0403] The compounds of this invention can also be administered in sustained release forms or from sustained release drug delivery systems. A description of representative sustained release materials can be found in *Remington's Pharmaceutical Sciences*.

[0404] When the compositions provided herewith comprise a combination of a compound of the formulae described herein and one or more additional therapeutic or prophylactic agents, both the compound and the additional agent should be present at dosage levels of between about 1 to 100%, and more preferably between about 5 to 95% of the dosage normally administered in a monotherapy regimen. The additional agents may be administered separately, as part of a multiple dose regimen, from the compounds provided herewith. Alternatively, those agents may be part of a single dosage form, mixed together with the compounds provided herewith in a single composition.

[0405] The present invention also relates to the pharmaceutically acceptable acid addition salt of a compound described herein (*e.g.*, compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1).

[0406] The acid which may be used to prepare the pharmaceutically acceptable salt is that which forms a non-toxic acid addition salt, *i.e.*, a salt containing pharmacologically acceptable anions such as the hydrochloride, hydroiodide, hydrobromide, nitrate, sulfate, bisulfate, phosphate, acetate, lactate, citrate, tartrate, succinate, maleate, fumarate, benzoate, para-toluenesulfonate, and the like.

[0407] The compounds described herein can, for example, be administered by injection, intravenously, intraarterially, subdermally, intraperitoneally, intramuscularly, or subcutaneously; or orally, buccally, nasally, transmucosally, topically, in an ophthalmic preparation, or by inhalation, with a dosage ranging from about 0.5 to about 100 mg/kg of

body weight, alternatively dosages between 1 mg and 1000 mg/dose, every 4 to 120 hours, or according to the requirements of the particular drug. The methods herein contemplate administration of an effective amount of compound or compound composition to achieve the desired or stated effect. Typically, the pharmaceutical compositions provided herewith will be administered from about 1 to about 6 times per day or alternatively, as a continuous infusion. Such administration can be used as a chronic or acute therapy. The amount of active ingredient that may be combined with the carrier materials to produce a single dosage form will vary depending upon the host treated and the particular mode of administration. A typical preparation will contain from about 5% to about 95% active compound (w/w). Alternatively, such preparations contain from about 20% to about 80% active compound.

[0408] Lower or higher doses than those recited above may be required. Specific dosage and treatment regimens for any particular patient will depend upon a variety of factors, including the activity of the specific compound employed, the age, body weight, general health status, sex, diet, time of administration, rate of excretion, drug combination, the severity and course of the disease, condition or symptoms, the patient's disposition to the disease, condition or symptoms, and the judgment of the treating physician.

[0409] Upon improvement of a patient's condition, a maintenance dose of a compound, composition or combination provided herewith may be administered, if necessary. Subsequently, the dosage or frequency of administration, or both, may be reduced, as a function of the symptoms, to a level at which the improved condition is retained when the symptoms have been alleviated to the desired level. Patients may, however, require intermittent treatment on a long term basis upon any recurrence of disease symptoms.

Combination therapies

[0420] The present invention provides methods of treatment of MTAP-deficient and/or MTA accumulating proliferative disorders (*e.g.*, cancers) with a PRMT5 inhibitor (*e.g.*, an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-

cooperative binding agent, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) in combination with a second therapeutic agent.

[0421] The term "Combination" refers to either a fixed combination in one dosage unit form, or a combined administration where a compound of the present invention (*e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) and a combination partner (*e.g.*, another drug as explained below, also referred to as "therapeutic agent" or "co-agent") may be administered independently at the same time or separately within time intervals, especially where these time intervals allow that the combination partners show a cooperative, *e.g.*, synergistic effect. The single components may be packaged in a kit or separately. One or both of the components (*e.g.*, powders or liquids) may be reconstituted or diluted to a desired dose prior to administration. The terms "co-administration" or "combined administration" or the like as utilized herein are meant to encompass administration of the selected combination partner to a single subject in need thereof (*e.g.*, a patient), and are intended to include treatment regimens in which the agents are not necessarily administered by the same route of administration or at the same time. The term "pharmaceutical combination" as used herein means a product that results from the mixing or combining of more than one therapeutic agent and includes both fixed and non–fixed combinations of the therapeutic agents. The term "fixed combination" means that the therapeutic agents, *e.g.*, a compound of the present invention (*e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) and a combination partner, are both administered to a patient simultaneously in the form of a single entity or dosage. The term "non-fixed combination" means that the therapeutic agents, *e.g.*, a compound of the present invention (*e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) and a combination partner, are both administered to a patient as separate entities either simultaneously, concurrently or sequentially with no specific time limits, wherein such administration provides therapeutically effective levels of the two compounds in the body of the patient. The latter also applies to cocktail therapy, *e.g.*, the administration of three or more therapeutic agent.

[0422] The term "combination therapy" refers to the administration of two or more therapeutic agents to treat a therapeutic condition or disorder described in the present disclosure. Such administration encompasses co-administration of these therapeutic agents in

a substantially simultaneous manner, such as in a single capsule having a fixed ratio of active ingredients. Alternatively, such administration encompasses co-administration in multiple, or in separate containers (*e.g.*, tablets, capsules, powders, and liquids) for each active ingredient. Powders and/or liquids may be reconstituted or diluted to a desired dose prior to administration. In addition, such administration also encompasses use of each type of therapeutic agent in a sequential manner, either at approximately the same time or at different times.

[0423] In certain embodiments, compounds of the present invention are combined with other therapeutic agents, including, but not limited to, other anti-cancer agents, anti-allergic agents, anti-nausea agents (or anti-emetics), pain relievers, cytoprotective agents, and combinations thereof.

[0424] General Chemotherapeutic agents considered for use in combination therapies include anastrozole (Arimidex®), bicalutamide (Casodex®), bleomycin sulfate (Blenoxane®), busulfan (Myleran®), busulfan injection (Busulfex®), capecitabine (Xeloda®), N4-pentoxycarbonyl-5-deoxy-5-fluorocytidine, carboplatin (Paraplatin®), carmustine (BiCNU®), chlorambucil (Leukeran®), cisplatin (Platinol®), cladribine (Leustatin®), cyclophosphamide (Cytoxan® or Neosar®), cytarabine, cytosine arabinoside (Cytosar-U®), cytarabine liposome injection (DepoCyt®), dacarbazine (DTIC-Dome®), dactinomycin (Actinomycin D, Cosmegan), daunorubicin hydrochloride (Cerubidine®), daunorubicin citrate liposome injection (DaunoXome®), dexamethasone, docetaxel (Taxotere®), doxorubicin hydrochloride (Adriamycin®, Rubex®), etoposide (Vepesid®), fludarabine phosphate (Fludara®), 5-fluorouracil (Adrucil®, Efudex®), flutamide (Eulexin®), tezacitibine, Gemcitabine (difluorodeoxycitidine), hydroxyurea (Hydrea®), Idarubicin (Idamycin®), ifosfamide (IFEX®), irinotecan (Camptosar®), L-asparaginase (ELSPAR®), leucovorin calcium, melphalan (Alkeran®), 6-mercaptopurine (Purinethol®), methotrexate (Folex®), mitoxantrone (Novantrone®), mylotarg, paclitaxel (Taxol®), nab–paclitaxel (Abraxane®), phoenix (Yttrium90/MX-DTPA), pentostatin, polifeprosan 20 with carmustine implant (Gliadel®), tamoxifen citrate (Nolvadex®), teniposide (Vumon®), 6–thioguanine, thiotepa, tirapazamine (Tirazone®), topotecan hydrochloride for injection (Hycamptin®), vinblastine (Velban®), vincristine (Oncovin®), and vinorelbine (Navelbine®).

[0425] Further compounds of particular interest for combinations with the compounds of the present invention include: EGFR-inhibitors, such as cetuximab, panitumimab, erlotinib,

gefitinib and EGFRi NOS; MAPK-pathway inhibitors, such as BRAFi, panRAFi, MEKi, ERKi; PI3K-mTOR pathway inhibitors, such as alpha-specific PI3Ki, pan-class I PI3Ki and mTOR/PI3Ki, particularly everolimus and analogues thereof.

[0426] Specific compounds and classes of compounds acting via specific mechanisms can be particularly effective in conjunction with PRMT5 inhibitors (*e.g.*, an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent, *e.g.*, compounds of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof). For example, PRMT5 is known to associate with SWI/SNF chromatin remodeling complexes along with other co-repressor molecules like HDAC2. PRMT5 activity on target H4R3 and H3R8 is enhanced when lysine residues become deacetylated by HDAC enzymes. Thus, HDAC inhibitors can be effective (*e.g.*, synergistic) when used in conjunction with PRMT5 inhibitors (WO 011/079236).

[0427] Thus, PRMT5 inhibitors of the present disclosure can be used in combination with other compounds, for example: HDAC inhibitor or DNA methyltransferase inhibitor. In some embodiments, the HDAC inhibitor is Trichostatin A. In some embodiments, the DNA methyltransferase inhibitor is 5-azacytidine.

[0428] A PRMT5 inhibitor (*e.g.*, an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) can also be administered or co-administered in any order with a MAT2A inhibitor.

[0429] A PRMT5 inhibitor (*e.g.*, an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) can also be administered or co-administered in any order with an inhibitor of a protein which interacts with or is required for PRMT5 function, including, but not limited to, pICIN, WDR77 or RIOK1.

[0430] A PRMT5 inhibitor (*e.g.*, an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) can be administered in combination with a HDM2 inhibitor and/or with 5-FU. The loss has been observed of wild-type p53 as a consequence of HDM2 activation resulting from CDKN2A deletion. This relates to the inability of MTAP deleted cells to salvage ATP and methionine from endogenous methyl-thioadenosine (MTA). As a consequence, tumor cells

become differentially sensitive towards 5-FU and other purine analogues (*e.g.*, 6-thioguanine, 6-mercaptopurine).

[0431] Given that CDKN2A/MTAP loss also leads to deregulation of p16/CDK4/6 pathway, PRMT5 inhibitor (*e.g.*, an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) can be administered in combination with a CDK4 inhibitor, including, but not limited to, LEE011 or a CDK 4/6 inhibitor (*e.g.*, palbociclib (Ibrance®), ribociclib (Kisqali®), and abemaciclib (Verzenio ®).

[0432] A PRMT5 inhibitor (*e.g.*, an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) can be administered in combination with targeted treatments contingent on the dependency of individual target tumors on relevant pathways as determined by suitable predictive markers, including but not limited to: inhibitors of HDM2i, PI3K/mTOR-I, MAPKi, RTKi (EGFRi, FGFRi, METi, IGFiRi, JAKi, and WNTi.

[0433] A PRMT5 inhibitor (*e.g.*, MTA-uncompetitive PRMT5 inhibitors, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) can be administered in combination with immunotherapy.

[0434] In some embodiments, the compounds described herein are used with a cancer immunotherapy (*e.g.*, a checkpoint blocking antibody) to treat a subject (*e.g.*, a human subject), *e.g.*, having a disease or disorder described herein (*e.g.*, a cancer described herein)).

[0436] In some embodiments, the immunotherapeutic agent is an anti-PD-1 ligand (*e.g.*, PD-LI (*e.g.*, B7–HI or CD274); or PD-L2 (*e.g.*, B7-DC or CD273)). In some embodiments, the immunotherapeutic agent is an anti-PD-1 antibody (*e.g.*, anti-PD-1 or anti-PD-L1, *e.g.*, nivolumab (i.e., MDX-1106, BMS–936558, ONO-4538); CT-011; AMP-224; pembrolizumab; pidilizumab; or MK-3475). In some embodiments, the immunotherapeutic agent is an anti-PD-L1 antibody (*e.g.*, BMS936559 (i.e., MDX-1105); MEDI4736; MSB0010718C (avelumab); or MPDL-3280A).

[0437] In some embodiments, the immunotherapeutic agent is a checkpoint blocking antibody (*e.g.*, anti-TIM3, anti-LAG3, anti-TIGIT including IMP321 and MGA271).

[0438] In some embodiments, the immunotherapeutic agent is a cell-based therapy. In some embodiments, the cell-based therapy is a CAR-T therapy.

[0439] In some embodiments, the immunotherapeutic agent is a co-stimulatory antibody (*e.g.*, anti-4-1BB, anti–OX40, anti-GITR, anti–CD27, anti–CD40).

[0440] In some embodiments, the immunotherapeutic agent is a cancer vaccine such as a neoantigen. These vaccines can be developed using peptides or RNA, *e.g.*,

[0441] In some embodiments, the immunotherapeutic agent is an oncolytic virus.

[0442] In some embodiments, the immunotherapeutic agent is a STING pathway agonist. Exemplary STING agonists include MK-1454 and ADU-S100.

[0443] A PRMT5 inhibitor (*e.g.*, an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) can be administered in combination with disease-specific huMABs (*e.g.*, an anti–HER3 huMAB)

[0444] A PRMT5 inhibitor (*e.g.*, an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) can be administered in combination with ADCs/ADCCs contingent on the expression of relevant surface targets on target tumors of interest.

[0445] Some patients may experience allergic reactions to the compounds of the present invention and/or other anti-cancer agent(s) during or after administration; therefore, anti-allergic agents are often administered to minimize the risk of an allergic reaction. Suitable anti-allergic agents include corticosteroids, including, but not limited to, dexamethasone (*e.g.*, Decadron®), beclomethasone (*e.g.*, Beclovent®), hydrocortisone (also known as cortisone, hydrocortisone sodium succinate, hydrocortisone sodium phosphate, and sold under the tradenames Ala–Cort®, hydrocortisone phosphate, Solu–Cortef®, Hydrocort Acetate® and Lanacort®), prednisolone (sold under the tradenames Delta–Cortel®, Orapred®, Pediapred® and Prelone®), prednisone (sold under the tradenames Deltasone®, Liquid Red®, Meticorten® and Orasone®), methylprednisolone (also known as 6–methylprednisolone, methylprednisolone acetate, methylprednisolone sodium succinate, sold under the tradenames Duralone®, Medralone®, Medrol®, M-Prednisol® and Solu–Medrol®); antihistamines, such as diphenhydramine (*e.g.*, Benadryl®), hydroxyzine, and cyproheptadine; and

However, opioid analgesic drugs including, but not limited to, hydrocodone/paracetamol or hydrocodone/acetaminophen (*e.g.*, Vicodin®), morphine (*e.g.*, Astramorph® or Avinza®), oxycodone (*e.g.*, OxyContin® or Percocet®), oxymorphone hydrochloride (Opana®), and fentanyl (*e.g.*, Duragesic®) are also useful for moderate or severe pain.

[0448] In an effort to protect normal cells from treatment toxicity and to limit organ toxicities, cytoprotective agents (such as neuroprotectants, free-radical scavengers, cardioprotectors, anthracycline extravasation neutralizers, nutrients and the like) may be used as an adjunct therapy. Suitable cytoprotective agents include Amifostine (Ethyol®), glutamine, dimesna (Tavocept®), mesna (Mesnex®), dexrazoxane (Zinecard® or Totect®), xaliproden (Xaprila®), and leucovorin (also known as calcium leucovorin, citrovorum factor and folinic acid).

[0449] The structure of the active compounds identified by code numbers, generic or trade names may be taken from the actual edition of the standard compendium "The Merck Index" or from databases, *e.g.*, Patents International (*e.g.*, IMS World Publications).

[0450] The above-mentioned compounds, which can be used in combination with a compound of the present invention, can be prepared and administered as described in the art, including, but not limited to, in the documents cited above.

[0451] In one embodiment, the present invention provides pharmaceutical compositions comprising at least one compound of the present invention (*e.g.*, a PRMT5 inhibitor, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1) or a pharmaceutically acceptable salt thereof together with a pharmaceutically acceptable carrier

suitable for administration to a human or animal subject, either alone or together with other anti-cancer agents.

[0452] In one embodiment, the present invention provides methods of treating human or animal subjects having or having been diagnosed with an MTAP-deficient and/or MTA accumulating proliferative disorder (*e.g.*, cancer) comprising administering to the subject in need thereof a therapeutically effective amount of a compound of the present invention (*e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1) or a pharmaceutically acceptable salt thereof in combination with a second therapeutic agent.

[0453] In one embodiment, the present invention provides methods of an MTAP-deficient and/or MTA accumulating proliferative disorder (*e.g.*, cancer) in a subject in need thereof comprising administering to the subject a therapeutically effective amount of a compound of the present invention (*e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1) or a pharmaceutically acceptable salt thereof in combination with a second therapeutic agent.

[0454] In particular, compositions will either be formulated together as a combination therapeutic or administered separately.

[0455] In combination therapy, the compound of the present invention and other anti-cancer agent(s) may be administered either simultaneously, concurrently or sequentially with no specific time limits, wherein such administration provides therapeutically effective levels of the two compounds in the body of the patient.

[0463] In one aspect, the present invention provides a method of determining if a cancer will respond to therapeutic treatment with a PRMT5 inhibitor (*e.g.*, an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof), comprising the steps of:

[0478] In some embodiments, the method further comprises the step of determining the level of PRMT5 in the cancer cells.

Sample preparation

[0479] The invention further provides assays for the detection of MTAP deficiency and/or MTA accumulation. They can include detecting a mutation related to MTAP deficiency and/or MTA accumulation, *e.g.*, in a body fluid such as blood (*e.g.*, serum or plasma) bone marrow, cerebral spinal fluid, peritoneal/pleural fluid, lymph fluid, ascites, serous fluid, sputum, lacrimal fluid, stool, and urine, or in a tissue such as a tumor tissue. The tumor tissue can be fresh tissue or preserved tissue (*e.g.*, formalin fixed tissue, *e.g.*, paraffin-embedded tissue).

[0480] Body fluid samples can be obtained from a subject using any of the methods known in the art. Methods for extracting cellular DNA from body fluid samples are well known in the art. Typically, cells are lysed with detergents. After cell lysis, proteins are removed from DNA using various proteases. DNA is then extracted with phenol, precipitated in alcohol, and dissolved in an aqueous solution. Methods for extracting acellular DNA from body fluid samples are also known in the art. Commonly, a cellular DNA in a body fluid sample is separated from cells, precipitated in alcohol, and dissolved in an aqueous solution.

Detection of PRMT5 selectivity

[0481] Samples, once prepared, can be tested for MTAP deficiency and/or MTA accumulation, either or both of which indicates that the sample is sensitive to treatment with a PRMT5 inhibitor. Cells can be determined to be MTA accumulating by techniques known in the art; methods for detecting MTA include, as a non-limiting example, liquid chromatography–electrospray ionization–tandem mass spectrometry (LC-ESI-MS/MS), as described in Stevens et al. 2010. J. Chromatogr. A. 1217: 3282-3288; and Kirovski et al. 2011 Am. J. Pathol. 178: 1145-1152; and references cited therein. The detection of MTAP deficiency can be done by any number of ways, for example: DNA sequencing, PCR based methods, including RT-PCR, microarray analysis, Southern blotting, Northern blotting, Next Generation Sequencing, and dip stick analysis. In some embodiments, MTAP deficiency is evaluated by any technique known in the art, for example, immunohistochemistry utilizing an anti-MTAP antibody or derivative thereof, and/or genomic sequencing, or nucleic acid hybridization, or amplification utilizing at least one probe or primer comprising a sequence of at least 12 contiguous nucleotides (nt) of the sequence of MTAP wherein the primer is no longer than about 30 nt.

[0482] The polymerase chain reaction (PCR) can be used to amplify and identify MTAP deficiency from either genomic DNA or RNA extracted from tumor tissue. PCR is well known in the art and is described in detail in Saiki et al., Science 1988, 239:487.

[0483] Methods of detecting MTAP deficiency by hybridization are provided. The method comprises identifying MTAP deficiency in a sample by its inability to hybridize to MTAP nucleic acid. The nucleic acid probe is detectably labeled with a label such as a radioisotope, a fluorescent agent or a chromogenic agent. Radioisotopes can include without limitation; 3H, 32P, 33P and 35S etc. Fluorescent agents can include without limitation: FITC, texas red, rhodamine, etc.

[0484] The probe used in detection that is capable of hybridizing to MTAP nucleic acid can be from about 8 nucleotides to about 100 nucleotides, from about 10 nucleotides to about 75 nucleotides, from about 15 nucleotides to about 50 nucleotides, or about 20 to about 30 nucleotides. The kit can also provide instructions for analysis of patient cancer samples, wherein the presence or absence of MTAP deficiency indicates if the subject is sensitive or insensitive to treatment with a PRMT5 inhibitor.

[0485] Single stranded conformational polymorphism (SSCP) can also be used to detect MTAP deficiency. This technique is well described in Orita et al., PNAS 1989, 86:2766-2770.

Measurement of Gene Expression

[0486] Evaluation of MTAP deficiency and measurement of MTAP gene expression, and measurement of PRMT5 gene expression can be performed using any method or reagent known in the art.

[0487] Detection of gene expression can be by any appropriate method, including for example, detecting the quantity of mRNA transcribed from the gene or the quantity of cDNA produced from the reverse transcription of the mRNA transcribed from the gene or the quantity of the polypeptide or protein encoded by the gene. These methods can be performed on a sample by sample basis or modified for high throughput analysis. For example, using Affymetrix™ U133 microarray chips.

[0488] In one aspect, gene expression is detected and quantitated by hybridization to a probe that specifically hybridizes to the appropriate probe for that biomarker. The probes also can be attached to a solid support for use in high throughput screening assays using methods known in the art.

[0489] In one aspect, the expression level of a gene is determined through exposure of a nucleic acid sample to the probe-modified chip. Extracted nucleic acid is labeled, for example, with a fluorescent tag, preferably during an amplification step.

[0490] Hybridization of the labeled sample is performed at an appropriate stringency level. The degree of probe-nucleic acid hybridization is quantitatively measured using a detection device.

[0491] Alternatively, any one of gene copy number, transcription, or translation can be determined using known techniques. For example, an amplification method such as PCR may be useful. General procedures for PCR are taught in MacPherson et al., PCR: A Practical Approach, (IRL Press at Oxford University Press (1991)). However, PCR conditions used for each application reaction are empirically determined. A number of parameters influence the success of a reaction. Among them are annealing temperature and time, extension time, Mg 2+ and /or ATP concentration, pH, and the relative concentration of primers, templates, and deoxyribonucleotides. After amplification, the resulting DNA fragments can be detected by agarose gel electrophoresis followed by visualization with ethidium bromide staining and ultraviolet illumination. In one embodiment, the hybridized nucleic acids are detected by detecting one or more labels attached to the sample nucleic acids. The labels can be incorporated by any of a number of means well known to those of skill in the art. However, in one aspect, the label is simultaneously incorporated during the amplification step in the preparation of the sample nucleic acid. Thus, for example, polymerase chain reaction (PCR) with labeled primers or labeled nucleotides will provide a labeled amplification product. In a separate embodiment, transcription amplification, as described above, using a labeled nucleotide (*e.g.*, fluorescein-labeled UTP and/or CTP) incorporates a label in to the transcribed nucleic acids.

[0492] Alternatively, a label may be added directly to the original nucleic acid sample (*e.g.*, mRNA, polyA, mRNA, cDNA, etc.) or to the amplification product after the amplification is completed. Means of attaching labels to nucleic acids are well known to those of skill in the art and include, for example nick translation or end-labeling (*e.g.*, with a labeled RNA) by kinasing of the nucleic acid and subsequent attachment (ligation) of a nucleic acid linker joining the sample nucleic acid to a label (*e.g.*, a fluorophore).

[0493] In one example, the gene expression can be measured through an in-situ hybridization protocol that can detect RNA molecules on a slide containing tissue sections or cells (*e.g.*, through RNAscope®).

[0494] Detectable labels suitable for use in the present invention include any composition detectable by spectroscopic, photochemical, biochemical, immunochemical, electrical, optical or chemical means. Useful labels in the present invention include biotin for staining with labeled streptavidin conjugate, magnetic beads (*e.g.*, Dynabeads™), fluorescent dyes (*e.g.*, fluorescein, texas red, rhodamine, green fluorescent protein, and the like), radiolabels (*e.g.*, 3H, 125I, 35S, 14C, or 32P) enzymes (*e.g.*, horse radish peroxidase, alkaline phosphatase and others commonly used in an ELISA), and calorimetric labels such as colloidal gold or colored glass or plastic (*e.g.*, polystyrene, polypropylene, latex, etc.) beads.

[0495] Detection of labels is well known to those of skill in the art. Thus, for example, radiolabels may be detected using photographic film or scintillation counters, fluorescent markers may be detected using a photodetector to detect emitted light. Enzymatic labels are typically detected by providing the enzyme with a substrate and detecting the reaction product produced by the action of the enzyme on the substrate, and calorimetric labels are detected by simply visualizing the colored label. The detectable label may be added to the target (sample) nucleic acid(s) prior to, or after the hybridization, such as described in WO 97/10365. These detectable labels are directly attached to or incorporated into the target (sample) nucleic acid prior to hybridization. In contrast, "indirect labels" are joined to the hybrid duplex after hybridization. Generally, the indirect label is attached to a binding moiety that has been attached to the target nucleic acid prior to the hybridization. For example, the target nucleic acid may be biotinylated before the hybridization. After hybridization, an avidin-conjugated fluorophore will bind the biotin bearing hybrid duplexes providing a label that is easily detected. For a detailed review of methods of labeling nucleic acids and detecting labeled hybridized nucleic acids see Laboratory Techniques in Biochemistry and Molecular Biology, Vol. 24: Hybridization with Nucleic Acid Probes, P. Tijssen, ed. Elsevier, N.Y. (1993).

Detection of polypeptides

[0496] Protein levels of MTAP can be determined by examining protein expression or the protein product. Determining the protein level involves measuring the amount of any immunospecific binding that occurs between an antibody that selectively recognizes and binds to the polypeptide of the biomarker in a sample obtained from a subject and comparing this to the amount of immunospecific binding of at least one biomarker in a control sample.

[0497] A variety of techniques are available in the art for protein analysis. They include but are not limited to radioimmunoassays, ELISA (enzyme linked immunosorbent assays),

"sandwich" immunoassays, immunoradiometric assays, in situ immunoassays (using *e.g.*, colloidal gold, enzyme or radioisotope labels), Western blot analysis, immunoprecipitation assays, immunofluorescent assays, flow cytometry, immunohistochemistry, HPLC, mass spectrometry, confocal microscopy, enzymatic assays, surface plasmon resonance and PAGE-SDS.

Adjacent biomarkers

[0498] Near or adjacent to MTAP on chromosome 9 are several other biomarkers. CDKN2A is often, if not usually, deleted along with MTAP. Additional genes or pseudogenes in this region include: C9orf53, ERVFRD-3, TUBB8P1, KHSRPP1, MIR31, and MIR31HG.

[0499] In some embodiments of the methods, the cell that is MTAP-deficient is also deficient in CDKN2A. In some embodiments, the cell that is MTAP-deficient is also deficient in one or more of: CDKN2A, C9orf53, ERVFRD-3, TUBB8P1, KHSRPP1, MIR31, and MIR31HG.

[0500] Thus, in various methods involving a step of evaluating a cell for MTAP deficiency or determining if a cell is MTAP-deficient, this step can comprise the step of determining if the cell is deficient for one or more of these markers: CDKN2A, C9orf53, ERVFRD-3, TUBB8P1, KHSRPP1, MIR31, and MIR31HG.

[0501] Thus, in some embodiments, the disclosure encompasses: A method of determining if a subject having or having been diagnosed with a cancer will respond to therapeutic treatment with a PRMT5 inhibitor (*e.g.*, an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent), comprising the steps of:

d) determining the level of PRMT5 activity in the subject following step c), wherein a decrease in the level of PRMT5 activity is correlated with the inhibition of the proliferation of the cancer, and wherein steps c) and d) are performed after steps a) and b).

[0502] In some embodiments, the disclosure encompasses: A method of determining if a cancer will respond to therapeutic treatment with a PRMT5 inhibitor (*e.g.*, an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent), comprising the steps of:

a) evaluating a test sample obtained from a subject having or having been diagnosed with said cancer for MTAP deficiency, and evaluating a reference sample from a non-cancerous or normal control subject for MTAP deficiency, wherein MTAP deficiency in the test sample relative to the reference sample indicates that the cancer will respond to therapeutic treatment with a PRMT5 inhibitor (*e.g.*, an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof); wherein MTAP deficiency is evaluated by evaluating the deficiency of one or more of the following biomarkers: CDKN2A, C9orf53, ERVFRD-3, TUBB8P1, KHSRPP1, MIR31, and MIR31HG, and wherein the method can further comprise the following steps:

b) determining the level of MTAP in the subject, wherein steps a) and b) can be performed in any order;

c) administering a therapeutically effective amount of a PRMT5 inhibitor (*e.g.*, an MTA-uncompetitive PRMT5 inhibitor, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) to the subject; and

d) determining the level of PRMT5 activity in the subject following step c), wherein a decrease in the level of PRMT5 activity is correlated with the inhibition of the proliferation of the cancer, and wherein steps c) and d) are performed after steps a) and b).

Assaying for biomarkers and PRMT5 inhibitor treatment

[0503] A number of patient stratification strategies could be employed to find patients likely to be sensitive to PRMT5 inhibition with an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent (*e.g.*, a PRMT5 inhibitor of the present invention, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof), including but not limited to, testing for MTAP deficiency and/or MTA accumulation.

[0504] Once a patient has been assayed for MTAP deficiency and/or MTA accumulation and predicted to be sensitive to treatment with a PRMT5 inhibitor, administration of any PRMT5 inhibitor (*e.g.*, an MTA-uncompetitive, non-competitive, or mixed mode PRMT5 inhibitor or an MTA-cooperative binding agent, *e.g.*, a compound of Formula (I), (Ia), (Ib), (Ic) and (Id) or a compound of Table 1, or pharmaceutically acceptable salts thereof) to a patient can be effected in one dose, continuously or intermittently throughout the course of treatment. Methods of determining the most effective means and dosage of administration are well known to those of skill in the art and will vary with the composition used for therapy, the purpose of the therapy, the target cell being treated, and the subject being treated. Single or multiple administrations can be carried out with the dose level and pattern being selected by the treating physician. Suitable dosage formulations and methods of administering the agents may be empirically adjusted.

[0506] In one embodiment, a for predicting the sensitivity of a subject having or having been diagnosed with an MTAP-deficiency-related cancer for treatment with a PRMT5 inhibitor is provided. The kit comprises: i) reagents capable of detecting human MTAP-deficient and/or MTA-accumulating cancer cells; and ii) instructions for how to use said kit.

General experimental notes:

[0508] In the following examples, the chemical reagents were purchased from commercial sources (such as Alfa, Acros, Sigma Aldrich, TCI and Shanghai Chemical Reagent Company), and used without further purification.

[0509] In some examples, purification of intermediates and final compounds was performed using HPLC (H_2O – MeOH; Agilent 1260 Infinity systems equipped with DAD and mass-detectors. Waters Sunfire C18 OBD Prep Column, 100Å, 5 µm, 19 mm X 100 mm with SunFire C18 Prep Guard Cartridge, 100Å, 10 µm, 19 mm X 10 mm) The material was dissolved in 0.7 mL DMSO. Flow: 30 mL/min. Purity of the obtained fractions was checked via the analytical LCMS. Spectra were recorded for each fraction as it was obtained straight after chromatography in the solution form. The solvent was evaporated under the N_2 flow upon heating to 80 °C. On the basis of post-chromatography LCMS analysis fractions were united. Solid fractions were dissolved in 0.5 mL MeOH and transferred into pre-weighted marked vials. Obtained solutions were again evaporated under the N_2 flow upon heating to

80 °C. After drying, products were subjected to lyophilization using acetonitrile-water mixtures and finally characterized by LCMS and ^{1}H NMR.

[0510] Nuclear magnetic resonance (NMR) spectra were recorded using Brucker AVANCE DRX 500, Bruker 400 spectrometer or Varian UNITYplus 400. Chemical shifts for protons were reported as parts per million in δ scale using solvent residual peak ($CHCl_3$: 7.27 ppm) (methanol-d_4: 3.31 ppm) (DMSO-d_6: 2.50 ppm) or tetramethylsilane (0.00 ppm) as internal standards. Chemical shifts of ^{13}C NMR spectra were reported in ppm from the central peak of $CDCl_3$ (77.00 ppm) (methanol-d_4: 49.15 ppm) (DMSO-d_6: 39.51 ppm) on the δ scale. Data are represented as follows: chemical shift, multiplicity (s = singlet, d = doublet, t = triplet, q = quartet, qn = quintuplet, sx = sextet, sp = septuplet, m = multiplet, br = broad), coupling constant (J, Hz) and integration.

[0511] In certain examples, mass spectra were recorded on an Agilent 1100 Series LC/MSD system with DAD\ELSD and Agilent LC\MSD VL (G1956A), SL (G1956B) mass-spectrometer or an Agilent 1200 Series LC/MSD system with DAD\ELSD and Agilent LC\MSD SL (G6130A), SL (G6140A) mass-spectrometer.

All the LC/MS data were obtained using positive/negative mode switching.

Exemplary TLC, concentration and normal phase chromatography.

[0520] Analytical thin layer chromatography (TLC) was performed with silica gel 60 F254 aluminum plates. Visualization was done under a UV lamp (254 nm) and by iodine or immersion in ethanolic phosphomolybdic acid (PMA) or potassium permanganate ($KMnO_4$), followed by heating using a heat gun. Organic solutions were concentrated by rotary evaporation at 20~40 °C. Purification of reaction products were generally done by flash column chromatography with 230−400 mesh silica gel or Agela flash silica column.

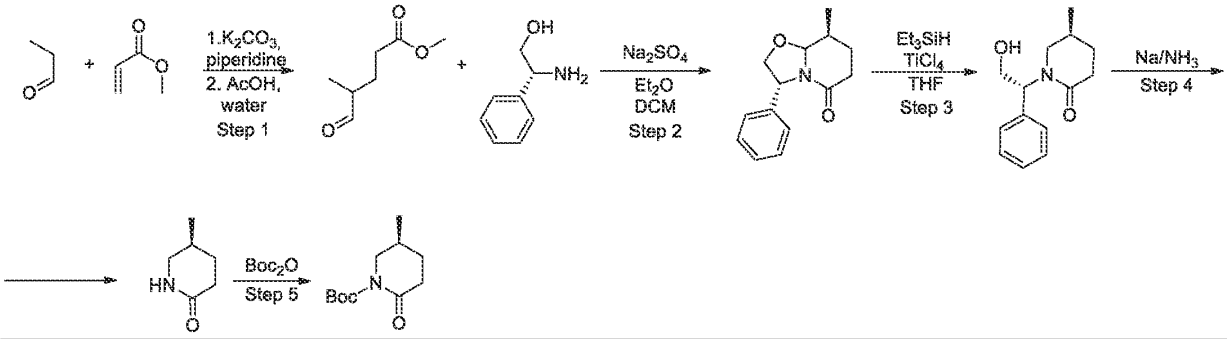
1. Synthesis of common intermediates

1A. **The synthesis of (*S*)-tert-butyl 5-methyl-2-oxopiperidine-1-carboxylate**



Step 1: Synthesis of methyl 4-methyl-5-oxopentanoate

[0536] To a stirring mixture of Piperidine, 99% (293.22 g, 3.44 mol, 340.16 mL) and Potassium carbonate - granular (95.19 g, 688.72 mmol, 41.57 mL), propanal (100 g, 1.72 mol, 123.46 mL) was added drop wise. The reaction mixture was stirred at room temperature for 18 hours. After 18 hours, the reaction mixture was filtered through a pad of Na_2SO_4 and washed with MTBE (1000 mL). The filtrate was dried over Na_2SO_4, filtered and concentrated under reduced pressure. The obtained crude enamine was dissolved in MeCN (1000 mL) and methyl prop-2-enoate (296.46 g, 3.44 mol, 310.10 mL) was added dropwise to the solution at room temperature. The resulting reaction mixture was refluxed for 16 hours. After 16 hours, Acetic acid (206.79 g, 3.44 mol, 196.94 mL) was added (carefully), followed by water (1000 mL) and the resulting solution was heated at reflux for an additional 16 hours. Then, the mixture was cooled to room temperature, saturated with NaCl and extracted with MTBE (2x1000 mL). The combined organic phase was dried over Na_2SO_4, filtered and concentrated under reduced pressure to obtain crude product methyl 4-methyl-5-oxo-pentanoate (264 g, crude). The crude product was used for the next step without any further purification.

^{1}H NMR($CDCl_3$, 500 MHz): δ 1.09 (d, 3H), 1.60 – 1.72 (m, 1H), 1.94 – 2.00 (m, 1H), 2.29 – 2.42 (m, 3H), 3.64 (s, 3H), 9.59 (s, 1H).

Step 2: Synthesis of (3R,8S,8aR)-8-methyl-3-phenyltetrahydro-2H-oxazolo[3,2-a]pyridin-5(3H)-one

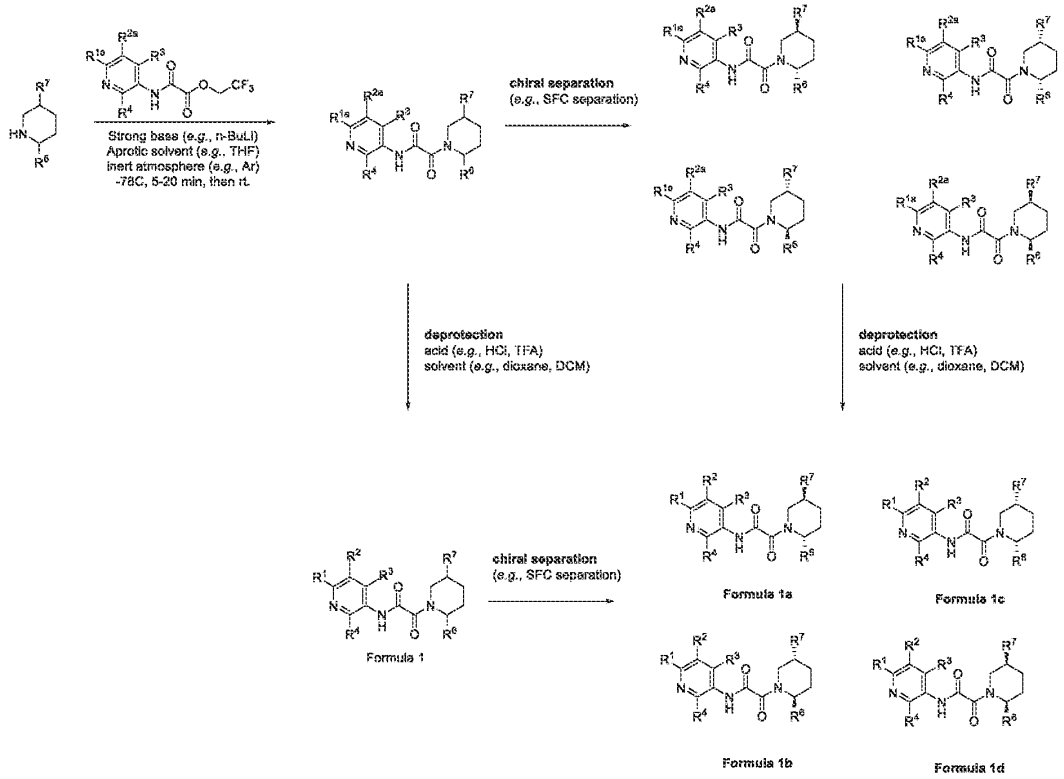
Scheme A. Synthesis of Compounds of Formula 1

[1207] Compounds of Formula 1, 1a, 1b, 1c and 1d are compounds of Formula (I), (Ia), (Ib), (Ic) and (Id) wherein R^1, R^2 R^3, R^4, R^6, R^7 and R^8 are as defined herein, and at least one of R^1 or R^2 are $-NH_2$,
R^{1a} is R^1 or -NH-PG, R^{2a} is R^2 or -NH-PG. PG is a nitrogen protecting groups as described herein (*e.g.*, -Boc).

General Procedure 1



Note that in certain instances the starting piperidine is already in a cis or trans configuration. In those cases, the chiral separation step only results in two of the four enantiomers depicted.

[1208] As shown in Scheme A, compounds of Formula (Ia), (Ib), (Ic), and (Id) can be separated from a mixture of compounds of Formula (I), wherein R^1, R^2, R^3, R^4, R^6, R^7, R^8, and n are as described herein. Alternatively, compounds of Formula (Ia), (Ib), (Ic), and (Id) can be prepared from their protected precusors. In some embodiments, R^{1a} is selected from R^1 and -NH-PG and R^{2a} is selected from R^2 and -NH-PG, wherein PG is a nitrogen protecting group as defined herein (*e.g.*, -Boc). In certain embodiments (*e.g.*, when R^{1a} is NH-PG and R^1 is $-NH_2$ or R^{2a} is NH-PG and R^2 is $-NH_2$), a deprotection step is employed to convert R^{1a} to R^1 or R^{2a} to R^2. In some embodiments, deprotection can take place before or after chiral separation. Conditions for removing a protecting group -PG (*e.g*, -Boc) can employ, for example, acidic conditions, (*e.g.*, water/dioxane, hydrochoric acid in a protic solvent (*e.g.*, methanol), hydrochloric acid in an aprotic solvent (*e.g.*, dioxane), TFA in an an aprotic solvent (*e.g.*, dichoromethane, chloroform, etc)). In some emboidments, a deproction step employs HCl (4.0M) in dioxane. In some emboidments, a deproction step employs HCl (4.0M) in DCM.

[1209] Methods of chiral separation are known to persons of ordinary skill in the art. For example, in some embodiments, chiral separation can be accomplished through the use of chiral HPLC purification (Column: AD-H III (250*20 mm, 5 μm). Exemplary eluents include, but are not limited to, hexane, IPA, MeOH, MeCN, and H_2O, and mixtures thereof.

[1210] As shown in Scheme A, preparation of compounds describe herein can include an amide bond coupling step. In some embodiments, an amide bond coupling comprises the coupling of a piperidine to a 2,2,2-trifluoroethyl ester in the presence of a strong base (*e.g.*, an alkyl lithium base) in an aprotic solvent (*e.g.*, THF) under an inert atmosphere (*e.g.*, under Argon). In some embodiments, the reaction takes place at temperatures between -100 °C and -60 °C. In some embodiments, the reaction takes place at temperatures of around -78°C. In some embodiments an amide bond coupling comprises use of *n*-BuLi in THF at -78 °C.
