Abstract

The pressure-flushing cistern comprises a pressure tank (2), an actuating device for initiating a flush and also a pressure-reducing valve (27), which is to be connected to a water pipe and via which the pressure tank (2) can be filled with flushing water. The closing pressure of the pressure-reducing valve (27) is adjustable with a displaceable ring (17). The ring (17) can be gripped from outside through a window (19) of a housing (6) for adjusting the closing pressure. Adjustment preferably takes place by steps.
