PATENT APPLICATION

TITLE

COSMETIC AND/OR PHARMACEUTICAL COMPOSITION IN DISPERSION FORM, METHOD FOR PREPARING SAME AND USE FOR TREATING THE SKIN

ABSTRACT

The invention relates to a cosmetic, dermatological and/or pharmaceutical composition, in particular for topical use, in the form of a dispersion of a discontinuous internal phase in a continuous external phase, one of the phases being an aqueous phase and the other being an oily phase. This composition contains a polyacrylic polymer and a consistency factor, and it is free of surfactant and of preservative. A method for preparing this composition comprises mixing the aqueous phase and the oily phase so as to form a homogeneous dispersion, and sterilizing the dispersion thus formed by ultra-high temperature infusion sterilization.
