TRANSACTION PROCESSING METHOD, ACQUIRING SYSTEM, AND STORAGE MEDIUM

ABSTRACT

This specification provides a transaction processing method, an acquiring system, and a storage medium. In this method, in response to a received payment request corresponding to a target transaction generated by a target merchant, the acquiring system obtains transaction information of the target transaction, and obtains a preset rule set. The target merchant corresponds to at least one service development identity. Different service development identities are used when service development is performed in different geographical regions. The rule set includes a plurality of identification rules for performing service development identity identification. The acquiring system identifies, based on matching between the transaction information and the plurality of identification rules, a target service development identity used by the target merchant when the target merchant generates the target transaction. Further, the acquiring system performs acquisition processing on the target transaction based on the target service development identity, so that an acquisition processing process of the target transaction complies with an acquisition specification of a geographical region corresponding to the target service development identity.
