DEVICE FOR STORAGE AND INHALATION OF NICOTINE AND METHOD FOR MANUFACTURING THE SAME

Abstract

There is a device (40) for inhaling vaporized nicotine (13) having one or more containers (10) for storing vaporized nicotine (13) and a chamber (30) configured to receive depressurized vaporized nicotine (13) from the container (10). Each container (10) has a housing (12) having an enclosed space for receiving the vaporized nicotine. Each container (10) also has a stopper (17) disposed at a first end (11) of the housing and adapted to receive one or more tubes (18). The chamber (30) has a hole (32) so sized and shaped to fit into a mouth of a user, one or more openings (34) adapted to receive the respective first ends (11) of the containers (10), and wherein the chamber (30) and the housing (12) are arranged such that a force applied to the chamber (30) toward the housing (12) or a force applied to the housing (12) toward the chamber (30) causes the vaporized nicotine (13) to be released into the chamber (30).
