Abstract

In situ hybridization method

There is provided an improved method of in situ hybridization. In particular, a method of in situ hybridization of biopolymer(s) in a sample of cells, with the proviso that the digestion of polypeptides is not performed. The method may be applicable to detection of different types of biopolymers, including detection of nucleic acids and polypeptides in the same sample. In particular, the method is for the detection of chromosomal abnormalities in uncultured amniotic cells.
