

**CELL ADHESION-INHIBITING ANTIINFLAMMATORY**  
**AND IMMUNE-SUPPRESSIVE COMPOUNDS**

This application is a continuation-in-part of Application Serial Number 60/114,097, filed December 29, 1998.

**Technical Field**

The present invention relates to compounds that are useful for treating inflammatory and immune diseases, to pharmaceutical compositions comprising these  
10 compounds, and to methods of inhibiting inflammation or suppressing immune response in a mammal.

**Background**

Inflammation results from a cascade of events that includes vasodilation  
15 accompanied by increased vascular permeability and exudation of fluid and plasma proteins. This disruption of vascular integrity precedes or coincides with an infiltration of inflammatory cells. Inflammatory mediators generated at the site of the initial lesion serve to recruit inflammatory cells to the site of injury. These mediators (chemokines such as IL-8, MCP-1, MIP-1, and RANTES, complement fragments and

lipid mediators) have chemotactic activity for leukocytes and attract the inflammatory cells to the inflamed lesion. These chemotactic mediators which cause circulating leukocytes to localize at the site of inflammation require the cells to cross the vascular endothelium at a precise location. This leukocyte recruitment is accomplished by a process called cell adhesion.

Cell adhesion occurs through a coordinately regulated series of steps that allow the leukocytes to first adhere to a specific region of the vascular endothelium and then cross the endothelial barrier to migrate to the inflamed tissue (Springer, T.A., 1994, Traffic Signals for Lymphocyte Recirculation and Leukocyte Emigration: The Multistep Paradigm, Cell 76: 301-314; Lawrence, M. B., and Springer, T. A., 1991, Leukocytes' Roll on a Selectin at Physiologic Flow Rates: Distinction from and Prerequisite for Adhesion Through Integrins, Cell.65: 859-873; von Adrian, U., Chambers, J. D., McEnvoy, L.M., Bargatze, R.F., Arfos, K.E, and Butcher, E.C., 1991, Two-Step Model of Leukocyte-Endothelial Cell Interactions in Inflammation, Proc. Natl. Acad. Sci. USA 88: 7538-7542; and Ley, K., Gaetgens, P., Fennie, C., Singer, M.S., Lasky, L.H. and Rosen, S.D.,1991, Lectin-Like Cell Adhesion Molecule 1 Mediates Rolling in Mesenteric Venules *in vivo*, Blood 77: 2553-2555). These steps are mediated by families of adhesion molecules such as integrins, Ig supergene family members, and selectins which are expressed on the surface of the circulating leukocytes and on the vascular endothelial cells. The first step consists of leukocytes rolling along the vascular endothelial cell lining in the region of inflammation. The rolling step is mediated by an interaction between a leukocyte surface oligosaccharide,

such as Sialylated Lewis-X antigen (SLe<sup>x</sup>), and a selectin molecule expressed on the surface of the endothelial cell in the region of inflammation. The selectin molecule is not normally expressed on the surface of endothelial cells but rather is induced by the action of inflammatory mediators such as TNF- $\alpha$  and interleukin-1. Rolling decreases the velocity of the circulating leukocyte in the region of inflammation and allows the cells to more firmly adhere to the endothelial cell. The firm adhesion is accomplished by the interaction of integrin molecules that are present on the surface of the rolling leukocytes and their counter-receptors (the Ig superfamily molecules) on the surface of the endothelial cell. The Ig superfamily molecules or CAMs (Cell Adhesion Molecules) are either not expressed or are expressed at low levels on normal vascular endothelial cells. The CAM's, like the selectins, are induced by the action of inflammatory mediators like TNF-alpha and IL-1. The final event in the adhesion process is the extravasation of leukocytes through the endothelial cell barrier and their migration along a chemotactic gradient to the site of inflammation. This transmigration is mediated by the conversion of the leukocyte integrin from a low avidity state to a high avidity state. The adhesion process relies on the induced expression of selectins and CAM's on the surface of vascular endothelial cells to mediate the rolling and firm adhesion of leukocytes to the vascular endothelium.

The interaction of the intercellular adhesion molecule ICAM-1 (cd54) on endothelial cells with the integrin LFA-1 on leukocytes plays an important role in endothelial-leukocyte contact. Leukocytes bearing high-affinity LFA-1 adhere to endothelial cells through interaction with ICAM-1, initiating the process of

extravasation from the vasculature into the surrounding tissues. Thus, an agent which blocks the ICAM-1/LFA-1 interaction suppresses these early steps in the inflammatory response. Consistent with this background, ICAM-1 knockout mice have numerous abnormalities in their inflammatory responses.

5       The present invention discloses compounds which bind to the interaction-domain (I-domain) of LFA-1, thus interrupting endothelial cell-leukocyte adhesion by blocking the interaction of LFA-1 with ICAM-1, ICAM-3, and other adhesion molecules. These compounds are useful for the treatment or prophylaxis of diseases in which leukocyte trafficking plays a role, notably acute and chronic inflammatory  
10   diseases, autoimmune diseases, tumor metastasis, allograft rejection, and reperfusion injury. The compounds of this invention are diaryl sulfides, which are substituted with a cinnamide moiety. The cinnamide functionality may be placed either ortho- or para- to the linking sulfur atom, although para-substitution is preferable. Appropriate substitution of both aromatic rings is tolerated, and can be used to modulate a variety  
15   of biochemical, physicochemical and pharmacokinetic properties. In particular the amide moiety is readily modified; a variety of secondary and tertiary amides are active, and alternatively a heterocyclic ring may be attached at this position. Modifications of this amide functionality are particularly useful in modulating physicochemical and pharmacokinetic properties.

**Summary of The Invention**

The present invention provides compounds of formula I, below,

**Detailed Description**

The term "alkanoyl" as used herein refers to an alkyl group attached to the parent molecular group through a carbonyl group.

The term "alkanoylamino" as used herein refers to an alkanoyl group attached  
5 to the parent molecular group through an amino group.

The term "alkanoylaminoalkyl" as used herein refers to an alkanoylamino group attached to the parent molecular group through an alkyl group.

The term "alkanoyloxy" as used herein refers to an alkanoyl group attached to the parent molecular group through an oxygen radical.

10 The term "alkanoyloxyalkyl" as used herein refers to an alkanoyloxy group attached to the parent molecular group through an alkyl group.

The term "alkoxy" as used herein refers to an alkyl group attached to the parent molecular group through an oxygen atom.

The term "alkoxyalkoxy" as used herein refers to an alkoxy group attached to  
15 the parent molecular group through an alkoxy group.

The term "alkoxyalkyl" as used herein refers to an alkoxy group attached to the parent molecular group through an alkyl group.

The term "alkoxycarbonyl" as used herein refers to an alkoxy group attached to the parent molecular group through a carbonyl group.

20 The term "alkoxycarbonylalkyl" as used herein refers to an alkoxycarbonyl group attached to the parent molecular group through an alkyl group.

The term "alkyl" as used herein refers to a saturated straight or branched chain group of 1-10 carbon atoms derived from an alkane by the removal of one hydrogen atom.

The term "alkyl(alkoxycarbonylalkyl)amino" as used herein refers to an amino group substituted with one alkyl group and one alkoxycarbonylalkyl group.

The term "alkyl(alkoxycarbonylalkyl)aminoalkyl" as used herein refers to an alkyl(alkoxycarbonylalkyl)amino group attached to the parent molecular group through an alkyl group.

The term "alkylene" as used herein refers to a divalent group of 1-10 carbon atoms derived from a straight or branched chain alkane by the removal of two hydrogen atoms.

The term "alkylsulfonyl" as used herein refers to an alkyl radical attached to the parent molecular group through an  $-SO_2-$  group.

The term "alkylsulfonylaminocarbonyl" as used herein refers to an alkylsulfonyl group attached to the parent molecular group through an aminocarbonyl group.

The term "amino" as used herein refers to a radical of the form  $-NR_{18}R_{19}$ , or to a radical of the form  $-NR_{18}-$ , where  $R_{18}$  and  $R_{19}$  are independently selected from hydrogen, alkyl or cycloalkyl.

The term "aminoalkanoyl" as used herein refers to an amino group attached to the parent molecular group through an alkanoyl group.

The term "aminoalkyl" as used herein refers to an amino group attached to the parent molecular group through an alkyl group.

The term "aminocarbonyl" as used herein refers to an amino group attached to the parent molecular group through a carbonyl group.

5       The term "aryl" as used herein refers to a mono- or bicyclic carbocyclic ring system having one or two aromatic rings. The aryl group can also be fused to a cyclohexane, cyclohexene, cyclopentane or cyclopentene ring. The aryl groups of this invention can be optionally substituted with alkyl, halogen, hydroxy, or alkoxy substituents.

10       The term "arylalkoxy" as used herein refers to an aryl group attached to the parent molecular group through an alkoxy group.

The term "arylalkoxycarbonyl" as used herein refers to an arylalkoxy group attached to the parent molecular group through a carbonyl group.

15       The term "arylsulfonyl" as used herein refers to an aryl radical attached to the parent molecular group through an  $-SO_2-$  group.

The term "arylsulfonylaminocarbonyl" as used herein refers to an arylsulfonyl group attached to the parent molecular group through an aminocarbonyl group.

The term "carboxaldehyde" as used herein refers to the radical  $-CHO$ .

20       The term "carboxaldehyde hydrazone" as used herein refers to the radical  $-CH=N-NR_{20}R_{21}$ , where  $R_{20}$  and  $R_{21}$  are independently selected from hydrogen, alkyl or cycloalkyl.

The terms "carboxamide" or "carboxamido" as used herein refer to an amino group attached to the parent molecular group through a carbonyl group.

The term "carboxamidoalkyl" as used herein refers to a carboxamido group attached to the parent molecular group through an alkyl group.

5 The term "carboxy" as used herein refers to the radical -COOH.

The term "carboxyalkyl" as used herein refers to a carboxy group attached to the parent molecular group through a alkyl group.

The term "carboxycarbonyl" as used herein refers to a carboxy group attached to the parent molecular group through a carbonyl group.

10 The term "cyano" as used herein refers to the radical -CN.

The term "cycloalkyl" as used herein refers to a monovalent saturated cyclic or bicyclic hydrocarbon group of 3-12 carbons derived from a cycloalkane by the removal of a single hydrogen atom. Cycloalkyl groups may be optionally substituted with alkyl, alkoxy, halo, or hydroxy substituents.

15 The terms "halo" or "halogen" as used herein refers to F, Cl, Br, or I.

The term "haloalkyl" as used herein refers to an alkyl group substituted with one or more halogen atoms.

The terms "heterocycle" or "heterocyclyl" represent a 4-, 5-, 6- or 7-membered ring containing one, two or three heteroatoms independently selected from the group consisting of nitrogen, oxygen and sulfur. The 4- and 5-membered rings have zero to two double bonds and the 6- and 7-membered rings have zero to three double bonds.  
20 The term "heterocycle" or "heterocyclic" as used herein additionally refers to bicyclic,

tricyclic and tetracyclic groups in which any of the above heterocyclic rings is fused to one or two rings independently selected from an aryl ring, a cyclohexane ring, a cyclohexene ring, a cyclopentane ring, a cyclopentene ring or another monocyclic heterocyclic ring. Heterocycles include acridinyl, benzimidazolyl, benzofuryl, benzothiazolyl, benzothienyl, benzoxazolyl, biotinyl, cinnoliny, dihydrofuryl, dihydroindolyl, dihydropyranyl, dihydrothienyl, dithiazolyl, furyl, homopiperidinyl, imidazolidinyl, imidazoliny, imidazolyl, indolyl, isoquinolyl, isothiazolidinyl, isothiazolyl, isoxazolidinyl, isoxazolyl, morpholiny, oxadiazolyl, oxazolidinyl, oxazolyl, piperazinyl, piperidinyl, pyranyl, pyrazolidinyl, pyrazinyl, pyrazolyl, pyrazoliny, pyridazinyl, pyridyl, pyrimidinyl, pyrimidyl, pyrrolidinyl, pyrrolidin-2-onyl, pyrroliny, pyrrolyl, quinoliny, quinoxaloyl, tetrahydrofuryl, tetrahydroisoquinolyl, tetrahydroquinolyl, tetrazolyl, thiadiazolyl, thiazolidinyl, thiazolyl, thienyl, thiomorpholiny, triazolyl, and the like.

Heterocyclics also include bridged bicyclic groups where a monocyclic heterocyclic group is bridged by an alkylene group such as

Heterocyclics also include compounds of the formula

where X\*

and Z\* are independently selected from -CH<sub>2</sub>-, -CH<sub>2</sub>NH-, -CH<sub>2</sub>O-, -NH- and -O-,

with the proviso that at least one of X\* and Z\* is not -CH<sub>2</sub>-, and Y\* is selected from

-C(O)- and -(C(R'')<sub>2</sub>)<sub>v</sub> -, where R'' is hydrogen or alkyl of one to four carbons, and v is 1-3. These heterocycles include 1,3-benzodioxolyl, 1,4-benzodioxanyl, 1,3-benzimidazol-2-one and the like. The heterocycle groups of this invention can be optionally substituted with alkyl, halogen, hydroxy or alkoxy substituents.

5       The term "heterocyclalkyl" as used herein refers to an heterocyclic group attached to the parent molecular group through an alkyl group.

      The term "heterocyclalkylamino" as used herein refers to an heterocyclalkyl group attached to the parent molecular group through an amino group.

10       The term "heterocyclalkylaminocarbonyl" as used herein refers to a heterocyclalkylamino group attached to the parent molecular group through a carbonyl group.

      The term "heterocyclamino" as used herein refers to a heterocycl group attached to the parent molecular group through a amino group.

15       The term "heterocyclcarbonyl" as used herein refers to a heterocycl group attached to the parent molecular group through a carbonyl group.

      The term "heterocyclsulfonyl" as used herein refers to a heterocycl radical attached to the parent molecular group through an -SO<sub>2</sub>- group.

      The term "heterocyclsulfonylaminocarbonyl" as used herein refers to a  
20   heterocyclsulfonyl group attached to the parent molecular group through an aminocarbonyl group.

The term "hydroxyalkanoyl" as used herein refers to an hydroxy radical attached to the parent molecular group through an alkanoyl group.

The term "hydroxyalkoxy" as used herein refers to an hydroxy radical attached to the parent molecular group through an alkoxy group.

5       The term "hydroxyalkoxyalkyl" as used herein refers to an hydroxyalkoxy group attached to the parent molecular group through an alkyl group.

The term "hydroxyalkyl" as used herein refers to an hydroxy radical attached to the parent molecular group through an alkyl group.

10       The term "hydroxyalkylaminocarbonyl" as used herein refers to an hydroxyalkyl group attached to the parent molecular group through an aminocarbonyl group.

The term "perfluoroalkyl" as used herein refers to an alkyl group in which all of the hydrogen atoms have been replaced by fluoride atoms.

15       The term "phenyl" as used herein refers to a monocyclic carbocyclic ring system having one aromatic ring. The phenyl group can also be fused to a cyclohexane or cyclopentane ring. The phenyl groups of this invention can be optionally substituted with alkyl, halogen, hydroxy or alkoxy substituents.

20       The term "pharmaceutically-acceptable prodrugs" as used herein represents those prodrugs of the compounds of the present invention which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and lower animals with undue toxicity, irritation, allergic response, and the like,

commensurate with a reasonable benefit/risk ratio, and effective for their intended use, as well as the zwitterionic forms, where possible, of the compounds of the invention.

The term "prodrug," as used herein, represents compounds which are rapidly transformed *in vivo* to the parent compound of the above formula, for example, by hydrolysis in blood. A thorough discussion is provided in T. Higuchi and V. Stella, Pro-drugs as Novel Delivery Systems, Vol. 14 of the A.C.S. Symposium Series, and in Edward B. Roche, ed., Bioreversible Carriers in Drug Design, American Pharmaceutical Association and Pergamon Press, 1987, both of which are incorporated herein by reference.

10 The term "sulfonate" as used herein refers to the radical  $-\text{SO}_3\text{H}$

The term "tetrazole" or "tetrazolyl" as used herein refers to the heterocyclic radical  $-\text{CN}_4\text{H}$ .

The term "thioalkoxy" as used herein refers to an alkyl group attached to the parent molecular group through a sulfur atom.

15 Compounds of the present invention can exist as stereoisomers wherein asymmetric or chiral centers are present. These compounds are designated by the symbols "R" or "S," depending on the configuration of substituents around the chiral carbon atom. The present invention contemplates various stereoisomers and mixtures thereof. Stereoisomers include enantiomers and diastereomers, and mixtures of enantiomers or diastereomers are designated ( $\pm$ ). Individual stereoisomers of 20 compounds of the present invention can be prepared synthetically from commercially available starting materials which contain asymmetric or chiral centers or by

preparation of racemic mixtures followed by resolution well-known to those of ordinary skill in the art. These methods of resolution are exemplified by (1) attachment of a mixture of enantiomers to a chiral auxiliary, separation of the resulting mixture of diastereomers by recrystallization or chromatography and  
5 liberation of the optically pure product from the auxiliary, (2) salt formation employing an optically active resolving agent, or (3) direct separation of the mixture of optical enantiomers on chiral chromatographic columns.

Geometric isomers can also exist in the compounds of the present invention. The present invention contemplates the various geometric isomers and mixtures  
10 thereof resulting from the arrangement of substituents around a carbon-carbon double bond or arrangement of substituents around a carbocyclic ring. Substituents around a carbon-carbon double bond are designated as being in the Z or E configuration wherein the term "Z" represents substituents on the same side of the carbon-carbon double bond and the term "E" represents substituents on opposite sides of the carbon-  
15 carbon double bond. The arrangement of substituents around a carbocyclic ring are designated as cis or trans wherein the term "cis" represents substituents on the same side of the plane of the ring and the term "trans" represents substituents on opposite sides of the plane of the ring. Mixtures of compounds wherein the substituents are disposed on both the same and opposite sides of plane of the ring are designated  
20 cis/trans.

As is apparent from the foregoing descriptions, the compounds of Formula 1 are useful in a variety of forms, i.e., with various substitutions as identified.

Examples of particularly desirable compounds are quite diverse, and many are mentioned herein. Included are compounds in which  $R_1$  is a "cis-cinnamide" or a "trans-cinnamide", and  $R_2$  is hydrogen; or where  $R_3$  is a "cis-cinnamide" or a "trans-cinnamide", and  $R_1$  is hydrogen, or  $R_1$ ,  $R_2$ , and  $R_4$  are each independently hydrogen or alkyl, and  $R_5$  is halogen, haloalkyl or nitro. Further preferred compounds include those as above wherein  $R_{10}$  and  $R_{11}$  are each independently hydrogen, alkyl, cycloalkyl, alkoxy-carbonyl-alkyl, hydroxyalkyl, or heterocyclalkyl, or where  $NR_{10}R_{11}$  is heterocyclalkyl or substituted heterocyclalkyl, and where Ar is aryl, substituted aryl, heteroaryl, or substituted heteroaryl.

#### Pharmaceutical Compositions and Methods of Treatment

The present invention also provides pharmaceutical compositions which comprise compounds of the present invention formulated together with one or more pharmaceutically-acceptable carriers. The pharmaceutical compositions may be  
10 specially formulated for oral administration in solid or liquid form, for parenteral injection, or for rectal administration.

The pharmaceutical compositions of this invention can be administered to humans and other animals orally, rectally, parenterally, intracisternally, intravaginally, intraperitoneally, topically (as by powders, ointments, or drops),  
15 buccally, or as an oral or nasal spray. The term "parenteral" administration as used herein refers to modes of administration which include intravenous, intramuscular, intraperitoneal, intrasternal, subcutaneous and intraarticular injection and infusion.

Pharmaceutical compositions of this invention for parenteral injection comprise pharmaceutically-acceptable sterile aqueous or nonaqueous solutions,  
20 dispersions, suspensions or emulsions as well as sterile powders for reconstitution into sterile injectable solutions or dispersions just prior to use. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents or vehicles include water,

ethanol, polyols (such as glycerol, propylene glycol, polyethylene glycol, and the like), and suitable mixtures thereof, vegetable oils (such as olive oil), and injectable organic esters such as ethyl oleate. Proper fluidity can be maintained, for example, by the use of coating materials such as lecithin, by the maintenance of the required  
5 particle size in the case of dispersions, and by the use of surfactants.

These compositions may also contain adjuvants such as preservative, wetting agents, emulsifying agents, and dispersing agents. Prevention of the action of microorganisms may be ensured by the inclusion of various antibacterial and antifungal agents, for example, paraben, chlorobutanol, phenol sorbic acid, and the  
10 like. It may also be desirable to include isotonic agents such as sugars, sodium chloride, and the like. Prolonged absorption of the injectable pharmaceutical form may be brought about by the inclusion of agents which delay absorption such as aluminum monostearate and gelatin.

In some cases, in order to prolong the effect of the drug, it is desirable to slow  
15 the absorption of the drug from subcutaneous or intramuscular injection. This may be accomplished by the use of a liquid suspension of crystalline or amorphous material with poor water solubility. The rate of absorption of the drug then depends upon its rate of dissolution which, in turn, may depend upon crystal size and crystalline form. Alternatively, delayed absorption of a parenterally administered drug form is  
20 accomplished by dissolving or suspending the drug in an oil vehicle.

Injectable depot forms are made by forming microencapsule matrices of the drug in biodegradable polymers such as polylactide-polyglycolide. Depending upon

the ratio of drug to polymer and the nature of the particular polymer employed, the rate of drug release can be controlled. Examples of other biodegradable polymers include poly(orthoesters) and poly(anhydrides). Depot injectable formulations are also prepared by entrapping the drug in liposomes or microemulsions which are  
5 compatible with body tissues.

The injectable formulations can be sterilized, for example, by filtration through a bacterial-retaining filter, or by incorporating sterilizing agents in the form of sterile solid compositions which can be dissolved or dispersed in sterile water or other sterile injectable medium just prior to use.

10 Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is mixed with at least one inert, pharmaceutically-acceptable excipient or carrier such as sodium citrate or dicalcium phosphate and/or (a) fillers or extenders such as starches, lactose, sucrose, glucose, mannitol, and silicic acid, (b) binders such as, for example,  
15 carboxymethylcellulose, alginates, gelatin, polyvinylpyrrolidone, sucrose, and acacia, (c) humectants such as glycerol, (d) disintegrating agents such as agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, certain silicates, and sodium carbonate, (e) solution retarding agents such as paraffin, (f) absorption accelerators such as quaternary ammonium compounds, (g) wetting agents such as, for example,  
20 cetyl alcohol and glycerol monostearate, (h) absorbents such as kaolin and bentonite clay, and (i) lubricants such as talc, calcium stearate, magnesium stearate, solid

polyethylene glycols, sodium lauryl sulfate, and mixtures thereof. In the case of capsules, tablets and pills, the dosage form may also comprise buffering agents.

Solid compositions of a similar type may also be employed as fillers in soft and hard-filled gelatin capsules using such excipients as lactose or milk sugar as well  
5 as high molecular weight polyethylene glycols and the like.

The solid dosage forms of tablets, dragees, capsules, pills, and granules can be prepared with coatings and shells such as enteric coatings and other coatings well known in the pharmaceutical formulating art. They may optionally contain opacifying agents and can also be of a composition that they release the active  
10 ingredient(s) only, or preferentially, in a certain part of the intestinal tract, optionally, in a delayed manner. Examples of embedding compositions which can be used include polymeric substances and waxes.

The active compounds can also be in micro-encapsulated form, if appropriate, with one or more of the above-mentioned excipients.

15 Liquid dosage forms for oral administration include pharmaceutically-acceptable emulsions, solutions, suspensions, syrups and elixirs. In addition to the active compounds, the liquid dosage forms may contain inert diluents commonly used in the art such as, for example, water or other solvents, solubilizing agents and emulsifiers such as ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate,  
20 benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethyl formamide, oils (in particular, cottonseed, groundnut, corn, germ, olive, castor, and

sesame oils), glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan, and mixtures thereof.

Besides inert diluents, the oral compositions can also include adjuvants such as wetting agents, emulsifying and suspending agents, sweetening, flavoring, and  
5 perfuming agents.

Suspensions, in addition to the active compounds, may contain suspending agents as, for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metahydroxide, bentonite, agar-agar, and tragacanth, and mixtures thereof.

10 Compositions for rectal or vaginal administration are preferably suppositories which can be prepared by mixing the compounds of this invention with suitable non-irritating excipients or carriers such as cocoa butter, polyethylene glycol or a suppository wax which are solid at room temperature but liquid at body temperature and therefore melt in the rectum or vaginal cavity and release the active compound.

15 Compounds of the present invention can also be administered in the form of liposomes. As is known in the art, liposomes are generally derived from phospholipids or other lipid substances. Liposomes are formed by mono- or multi-lamellar hydrated liquid crystals that are dispersed in an aqueous medium. Any non-toxic, physiologically-acceptable and metabolizable lipid capable of forming  
20 liposomes can be used. The present compositions in liposome form can contain, in addition to a compound of the present invention, stabilizers, preservatives, excipients,

and the like. The preferred lipids are the phospholipids and the phosphatidyl cholines (lecithins), both natural and synthetic.

Methods to form liposomes are known in the art. See, for example, Prescott, Ed., Methods in Cell Biology, Volume XIV, Academic Press, New York, N.Y.

5 (1976), p. 33 et seq.

The compounds of the present invention may be used in the form of pharmaceutically-acceptable salts derived from inorganic or organic acids. By "pharmaceutically-acceptable salt" is meant those salts which are, within the scope of sound medical judgment, suitable for use in contact with the tissues of humans and  
10 lower animals without undue toxicity, irritation, allergic response and the like, and are commensurate with a reasonable benefit/risk ratio. Pharmaceutically-acceptable salts are well-known in the art. For example, S. M. Berge, *et al.* Describe pharmaceutically-acceptable salts in detail in J. Pharmaceutical Sciences, 1977, 66: 1 et seq. The salts may be prepared *in situ* during the final isolation and purification of  
15 the compounds of the invention or separately by reacting a free base function with a suitable acid. Representative acid addition salts include acetate, adipate, alginate, citrate, aspartate, benzoate, benzenesulfonate, bisulfate, butyrate, camphorate, camphorsulfonate, digluconate, glycerophosphate, hemisulfate, heptanoate, hexanoate, fumarate, hydrochloride, hydrobromide, hydroiodide, 2-hydroxyethanesulfonate  
20 (isethionate), lactate, maleate, methanesulfonate, nicotinate, 2-naphthalenesulfonate, oxalate, pamoate, pectinate, persulfate, 3-phenylpropionate, picrate, pivalate, propionate, succinate, tartrate, thiocyanate, phosphate, glutamate, bicarbonate, p-

toluenesulfonate and undecanoate. Also, the basic nitrogen-containing groups can be quaternized with such agents as lower alkyl halides such as methyl, ethyl, propyl, and butyl chlorides, bromides and iodides; dialkyl sulfates like dimethyl, diethyl, dibutyl and diamyl sulfates; long chain halides such as decyl, lauryl, myristyl and stearyl chlorides, bromides and iodides; arylalkyl halides like benzyl and phenethyl bromides and others. Water or oil-soluble or dispersible products are thereby obtained.

Examples of acids which may be employed to form pharmaceutically acceptable acid addition salts include such inorganic acids as hydrochloric acid, hydrobromic acid, sulphuric acid and phosphoric acid and such organic acids as oxalic acid, maleic acid, succinic acid and citric acid.

Basic addition salts can be prepared *in situ* during the final isolation and purification of compounds of this invention by reacting a carboxylic acid-containing moiety with a suitable base such as the hydroxide, carbonate or bicarbonate of a pharmaceutically acceptable metal cation or with ammonia or an organic primary, secondary or tertiary amine. Pharmaceutically-acceptable basic addition salts include cations based on alkali metals or alkaline earth metals such as lithium, sodium, potassium, calcium, magnesium and aluminum salts and the like and nontoxic quaternary ammonia and amine cations including ammonium, tetramethylammonium, tetraethylammonium, methylamine, dimethylamine, trimethylamine, triethylamine, diethylamine, ethylamine and the like. Other representative organic amines useful for the formation of base addition salts include ethylenediamine, ethanolamine, diethanolamine, piperidine, piperazine and the like.

Dosage forms for topical administration of a compound of this invention include powders, sprays, ointments and inhalants. The active compound is mixed under sterile conditions with a pharmaceutically-acceptable carrier and any needed preservatives, buffers, or propellants which may be required. Ophthalmic formulations, eye ointments, powders and solutions are also contemplated as being within the scope of this invention.

Actual dosage levels of active ingredients in the pharmaceutical compositions of this invention may be varied so as to obtain an amount of the active compound(s) that is effective to achieve the desired therapeutic response for a particular patient, compositions, and mode of administration. The selected dosage level will depend upon the activity of the particular compound, the route of administration, the severity of the condition being treated, and the condition and prior medical history of the patient being treated. However, it is within the skill of the art to start doses of the compound at levels lower than required for to achieve the desired therapeutic effect and to gradually increase the dosage until the desired effect is achieved.

Generally dosage levels of about 0.1 to about 50 mg, more preferably of about 5 to about 20 mg of active compound per kilogram of body weight per day are administered orally or intravenously to a mammalian patient. If desired, the effective daily dose may be divided into multiple doses for purposes of administration, e.g. two to four separate doses per day.

Preparation of Compounds of the Invention

The compounds and processes of the present invention may be better understood in connection with the following synthetic Schemes which illustrate the methods by which the compounds of the invention can be prepared.

Scheme 1

Scheme 1 describes the synthesis of a typical cinnamide-substituted diaryl sulfide 4 through an aldehyde intermediate 2. Aldehyde 2 is prepared by reaction of a thiophenol (for example 2,4-dichlorothiophenol, 2-bromothiophenol, or the like) with halo-substituted benzaldehyde derivative 1 (e.g. 2-chlorobenzaldehyde, 3-chloro, 4-fluorobenzaldehyde, or the like) in the presence of base (e.g. sodium carbonate, triethylamine, or the like) and a polar solvent (e.g. dimethylformamide, dimethylsulfoxide, or the like). The aldehyde group is homologated to the corresponding cinnamic acid 3, using an acetate equivalent (for example, malonic acid, triethoxyphosphonoacetate, or the like) in the presence of an appropriate base and solvent. In some cases, it may be necessary to hydrolyze an intermediate ester (for example using sodium hydroxide in alcohol). The acid group is activated (for

15

20

example using thionyl chloride, or dicyclohexylcarbodiimide and N-hydroxysuccinimide, or the like) and reacted with a primary or secondary amine (for example, 6-aminohexanol, pyrrolidone-3-propylamine, or the like) to provide the desired analog 4. In one variant, a halo-acetophenone can replace benzaldehyde 2; the resultant cinnamides 4 are substituted with a methyl group at the 3-position.

### Scheme 2

Alternatively, the order of these coupling steps may be reversed (Scheme 2). A substituted halocinnamic acid 5 (e.g. 3-chloro-2-nitrocinnamic acid or the like) may be coupled with a primary or secondary amine (e.g. N-acetylpiperazine or the like) as described above to give the corresponding amide 6. The halo-group can then be displaced with a substituted thiophenol in the presence of base to provide the product 7.

### Scheme 3

A number of the compounds described herein may be prepared from intermediate benzylic alcohols like 8 (Scheme 3). Activation of the alcohol moiety (for example, using phosphorus tribromide or methanesulfonyl chloride and lithium halide in dimethylformamide) and displacement with a primary or secondary amine (e.g. morpholine, N-formylpiperazine or the like) provides analogs with structures related to 9. Alternatively the alcohol may be oxidized (for example using TPAP or PCC or the like) to give aldehyde 10.

10

Scheme 4

Cinnamides like 13 may be prepared from halo-substituted derivatives 11 by palladium-mediated coupling [e.g. using tetrakis (o-tolyl phosphine) palladium (0), Pd<sub>2</sub>(dba)<sub>3</sub>, or the like] with acrylamide derivatives 12 (Scheme 4). In similar manner, anilino-cinnamides like 16 can be prepared by palladium-mediated coupling of amines 15 with halo-cinnamides 14.

Scheme 5

- 5 In some cases, functional groups on the aromatic rings can be modified to produce new analogs (Scheme 5). For example, a nitro group in compounds like 17 may be reduced (for example, with tin(II) chloride, or by catalytic hydrogenation, or the like) to the corresponding amine 18. This amine may then itself be converted to a halogen, for example by diazotization using nitrous acid or t-butyl nitrite in the
- 10 presence of a metal halide salt like cupric bromide, providing analog 19.

Scheme 6

15

It is also possible to assemble cinnamide-substituted diaryl sulfides in a "reverse" sense (Scheme 6). Thus, for example, compound 20, prepared as described in Scheme 1, may be deprotected by treatment with base (e.g. potassium t-butoxide or the like) to provide thiolate anion 21, which may be reacted with an activated

haloarene (e.g. 2,3-dichlorobenzaldehyde, 3-chloro,4-fluorobenzaldehyde or the like) to provide the corresponding product 22. Alternatively, this same thiolate anion may be coupled with unactivated aryl halides (e.g. aryl bromide or Aryl iodides) using a metal-catalyzed Ullman coupling procedure (for example, using a palladium or nickel catalyst) to give product 23.

A further method for producing diarylsulfide cinnamides is shown in Scheme 7, wherein the diaryl sulfide is formed through coupling of a suitably protected aryl thiol 28 to an activated cinnamate ester 27. Substituted phenol 24 may be brominated to give bromophenol 25. Heck-type coupling of bromide 25 with an appropriate olefinic substrate, for example methyl acrylate, is effected with palladium catalysis, leading to the cinnamate ester 26. The phenol is then activated towards further reaction, for example by conversion to the corresponding triflate 27 under standard conditions. The required protected thiol 28 may be prepared by the method of XXX (*Tetrahedron Lett.* 1994, 35, 3221-3224), by coupling an aryl halide or triflate with triisopropylsilyl thiol under palladium catalysis. The two partners 27 and 28 are then reacted in the presence of a fluoride source, for example cesium fluoride, to provide the diarylsulfide cinnamate 29. Hydrolysis is accomplished by basic media, such as lithium or sodium hydroxide in water-THF, and the resulting acid 30 is coupled to amines under standard amide-bond forming conditions (for example, EDC/HOBt) to produce the amides 31.

68

Scheme 7

A method for preparing cinnamides bearing two arylthio groups is outlined in Scheme 8. Commercially available difluoro cinnamic acid **32** was coupled with an amine, using standard conditions, and this derived amide **33** was reacted with excess aryl thiol to provide the bis-sulfide **34**.

Scheme 8

10

Compounds which contain trifluoromethyl groups on the cinnamide-portion of inhibitors were made by the method shown in Scheme 9. According to the method of

XXX (Ref), Diels-Alder reaction between 1,1,1,4,4,4-hexafluoro-2-butyne and 2-methylfuran led to bicyclic ether **35**, which was rearranged with Lewis acid (for example, boron trifluoride etherate) to the phenol **36**. The methyl group is then converted to the corresponding aldehyde **37** by bromination followed by reaction with dimethylsulfoxide. Using the analogous procedures described for Scheme 1 above, the phenol was activated and condensed with thiols under basic conditions to afford diarylsulfide aldehydes **38**, and further converted to cinnamides **39** by the previously described procedures.

Scheme 9

10

Cinnamides bearing more complex substituted piperidine amides can be produced by the methods outlined in Scheme 10 and 11. Cinnamic acids **40** are coupled to spiro-hydantoin piperidine **41**, and the derived amide **42** is first reacted with an activating reagent (for example di-tert-butyl dicarbonate), and then hydrolyzed to the amino acid **43**. The derived amino group may then be reacted further, for example with acid anhydrides or acid chlorides, to produce amides **44**.

70

Scheme 10

Further derivatives of piperidine amides can be obtained by coupling of piperidinone **45** with cinnamic acids **40**, as shown in Scheme 11. Standard coupling conditions lead to amide **46**, which is first reduced to the corresponding alcohol, then hydrolyzed to afford hydroxy acid **47**.

Scheme 11

Also included in this invention are compounds derived from coupling of amines, or amino acid derivatives (such as  $\alpha$ -amino esters) to the carboxylic acid group of cinnamides **48**, using standard coupling and hydrolysis methods, as outlined in Scheme 12. Thus, amides **49** are produced directly from amine coupling reactions.

5 Amino acid esters are coupled to **48**, and the derived esters are hydrolyzed to the corresponding acids **50**.

Scheme 12

Inhibitors bearing substituted piperazine (or homopiperazine) cinnamides may

10 be produced by the methods described in Scheme 13. The methods described may be utilized to produce piperazine amide **51**. Secondary amine **51** then serves as educt for preparing amides **52**, through standard coupling reactions. Alternatively, **51** may be converted to tertiary amines **53**, through standard reductive alkylation methods (for example, condensation with an aldehyde in the presence of a reducing agent such as

15 sodium triacetoxyborohydride).

Scheme 13

A process for preparing analogs with amino substitutions of the aryl portion of the sulfides is illustrated in Scheme 14. The intermediate triflate **27** is reacted with halo-substituted thiophenols **54** (X = Br, Cl, OTf, OTs) under basic catalysis, to provide the sulfide derivative **55**. The halogen or activated hydroxyl is then substituted with an amine, using the method of Buchwald (Old, D. W.; Wolfe, J. P.; Buchwald, S. L. *J. Am. Chem. Soc.* **1998**, *120*, 9722-9723). Similar transition-metal catalyzed reactions may be applied, for example, the method of Hartwig (Hamann, B. C.; Hartwig, J. F. *J. Am. Chem. Soc.* **1998**, *120*, 7369-7370). The NR<sub>3</sub>R<sub>4</sub> group may constitute a cyclic or acyclic group, optionally substituted with additional functionalities that may enhance the activities of the compounds, and that further synthetic transformations familiar to those skilled in the art may be applied. For instance, ester groups may be hydrolyzed to the corresponding carboxylic acids or amides. The derived anilino sulfides may then be processed as described above to produce the cinnamides **56**.

### EXAMPLES

The compounds and processes of the present invention may be better understood in connection with the following Examples, which are intended as an illustration of and not a limitation upon the scope of the invention.

#### Example 1

(2,4-Dichlorophenyl)[2-(*E*-((6-hydroxyhexylamino)carbonyl)ethenyl)phenyl] sulfide

10

#### Example 1A

2-[(2,4-Dichlorophenyl)thio]benzaldehyde

To a stirred solution of 2,4-dichlorothiophenol (2.0 g, 11.2 mmol) in 25 mL of anhydrous DMF was added potassium carbonate (3.09 g, 22.4 mmol), followed by 2-chlorobenzaldehyde (1.26 mL, 11.3 mmol). The mixture was then heated under nitrogen atmosphere at 70 °C for 5 hours. The reaction mixture was then allowed to cool to room temperature and partitioned between ether and water. The aqueous layer was extracted with ether once and the combined organic layer was washed with water and brine, dried over sodium sulfate and condensed in vacuo. The crude product was purified via silica gel flash chromatography, eluting with 5-10 % ether/hexanes, to give 2.62 g (9.25 mmol, 83%) of the desired aldehyde as a colorless oil, which solidified slowly upon standing at room temperature.

Example 1B*trans*-2-[(2,4-Dichlorophenyl)thio]cinnamic acid

A mixture of the aldehyde (1.50 g, 5.3 mmol) from Example 1A, malonic acid (1.21 g, 11.6 mmol), piperidine (78.6  $\mu$ L, 0.80 mmol) in 8.0 mL of anhydrous  
5 pyridine was heated at 110 °C for 2 hours. Gas evolution ceased during this period. Pyridine was then removed under vacuum. Water and 3N aq. HCl were then added with stirring. The desired cinnamic acid was then collected through filtration, washed with cold water and dried in a vacuum oven overnight to give 1.56 g (4.8 mmol, 91  
10 %) of white solid.

Example 1C(2,4-Dichlorophenyl)[2-(*E*-((6-hydroxyhexylamino)carbonyl)ethenyl)phenyl] sulfide

A suspension of the acid (284 mg, 0.87 mmol) from Example 1B in 5 mL of methylene chloride was stirred with (COCl)<sub>2</sub> (84  $\mu$ L, 0.97 mmol), and one drop of  
15 DMF under nitrogen atmosphere for 90 minutes. The solvent was then removed under vacuum. The residue (COCl)<sub>2</sub> was removed with benzene (2x) in vacuo. To a separate flask, previously filled with 6-amino-1-hexanol (12 mg, 0.10 mmol), Hunig's base (22.8  $\mu$ L, 0.13 mmol) and DMAP (1.1 mg, 0.008 mmol) in 2.0 mL of CH<sub>2</sub>Cl<sub>2</sub>, the acid chloride (30 mg, 0.087 mmol) in 1.0 mL of CH<sub>2</sub>Cl<sub>2</sub> was then dropped in  
20 slowly. After 30 minutes, the reaction mixture was poured into 3N HCl and extracted with ethyl acetate (EtOAc). The organic layer was washed with brine, dried with Na<sub>2</sub>SO<sub>4</sub>, condensed under reduced pressure. The crude product was purified by

preparative TLC to give 21.0 mg (90 %) of the title compound as a colorless oil. <sup>1</sup>H NMR (CDCl<sub>3</sub>, 300 MHz) δ 1.31-1.48 (m, 4H), 1.48-1.70 (m, 4H), 3.37 (q, *J* = 6.7 Hz, 2H), 3.65 (t, *J* = 6.3 Hz, 2H), 5.63 (br s, 1H), 6.36 (d, *J* = 15.9 Hz, 1H), 6.71 (d, *J* = 9.3 Hz, 1H), 7.05 (dd, *J* = 2.4, 8.7 Hz, 1H), 7.31-7.49 (m, 4H), 7.65 (dd, *J* = 2.1, 7.5 Hz, 1H), 7.99 (d, *J* = 15.9 Hz, 1H). #### Example 52B

(2-Chlorophenyl)[2-chloro-4-(*E*-(1-ethoxycarbonyl) 2-propenyl)phenyl] sulfide

To a stirred suspension of NaH (60% in mineral oil, 121 mg, 3.03 mmol) in 20 mL of anhydrous THF under nitrogen atmosphere was added triethyl phosphonoacetate dropwise. After 20 minutes, the acetophenone (600 mg, 2.02 mmol) from Example 52A in THF (5 mL) was added in one portion. The resulting clear solution was then stirred at room temperature for 7 hours. Reaction was then stopped, most of the solvent was evaporated, and the residue was partitioned between

EtOAc (2x20 mL) and water. The combined organic layer was washed with water and brine, dried over  $\text{Na}_2\text{SO}_4$ , concentrated in vacuo. The crude product was purified using silica gel flash column chromatography eluting with 5-10%  $\text{Et}_2\text{O}$  in hexanes to give the (*E*)-isomer of the cinnamate (500 mg, 68%) as a white solid.

Example 69(2-(Pyrrolidin-1-yl)phenyl)[2-chloro-4-(*E*-((morpholin-1-yl)carbonyl)

ethenyl) phenyl] sulfide

To a stirred solution of bromide (75 mg, 0.17 mmol) from Example 12 in toluene in a sealed tube was added sequentially pyrrolidine (18.4 mL, 0.22 mmol), Pd<sub>2</sub>(dba)<sub>3</sub> (3.0 mg, 0.0034mmol), BINAP (6.0 mg, 0.010mmol), followed by NaOt-Bu (26 mg, 0.27 mmol). The resulting mixture was then flushed with anhydrous N<sub>2</sub> for 2 min before it was capped and heated at 90 °C for 24 h. The reaction mixture was then allowed to cool down to room temperature and partitioned between ethyl acetate and brine. The organic layer was then dried with Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated in vacuo. The crude product was purified using Gilson Preparative HPLC as described in Example 38B to give the title compound (40 mg, 55% yield) as a white solid; <sup>1</sup>H NMR (CDCl<sub>3</sub>, 300 MHz) δ 1.83 (br s, 4H), 3.40 (br s, 4H), 3.56-3.80 (m, 8H), 6.57 (d, J = 8.4 Hz, 1H), 6.75 (d, J = 15.6 Hz, 1H), 6.81 (br t, J = 8.4 Hz, 1H), 6.90 (br s, 1H), 7.15 (dd, J = 2.1, 8.4 Hz, 1H), 7.18-7.27 (m, 1H), 7.32 (td, J = 1.8, 8.4 Hz, 1H), 7.42 (dd, J = 1.8, 7.8 Hz, 1H), 7.50 (d, J = 1.8 Hz, 1H), 7.55 (d, J = 15.6 Hz, 1H). ### Example 71A

**1-tert-Butyloxycarbonyl -2-carbomethoxypiperazine**

2-Carbomethoxypiperazine was treated with benzyl chloroformate (1.0 eq) in aqueous  $\text{NaHCO}_3$  to give 1-benzyloxycarbonyl-3-carbomethoxypiperazine. This material was treated with di-*tert*-butyldicarbonate (1.1 eq) and triethylamine (1.0 eq) in THF to produce 1-*tert*-butoxycarbonyl-4-benzyloxycarbonyl-2-carbomethoxypiperazine. Hydrogenation of this compound in methanol using 10% Pd-C gives the title compound after filtration and solvent removal.

The bromide was prepared by the procedure described in Example 12,  
20    substituting 2-bromothiophenol with 4-bromothiophenol, and 3,4-  
dichlorobenzaldehyde with 4-fluoro-3-trifluoromethylbenzaldehyde.

Example 256B

(4-Hydrazinophenyl)[2-trifluoromethyl-4-(E-((morpholin-1-yl)carbonyl)ethenyl) phenyl] sulfide, benzophenone hydrazone

To a stirred solution of above-described bromide (1.0 g, 2.12 mmol) in 10 mL  
5 of toluene with Pd(OAc)<sub>2</sub> (9.5 mg, 0.04 mmol), BINAP (40 mg, 0.06 mmol), and  
benzophenone hydrazone (437 mg, 2.12 mmol) was added NaOt-Bu (285 mg, 2.97  
mmol). The reaction mixture was bubbled with N<sub>2</sub> for 2 min before it was heated at 80  
°C for 4 h. The reaction mixture was then allowed to cool down to ambient  
temperature. Ether was then added and the mixture was filtered through celite, washed  
10 with diethyl ether. The filtrate was concentrate in vacuo and the residue was purified  
on a SiO<sub>2</sub> flash column chromatography eluting with 10-30% EtOAc/hexanes to give  
170 mg (13%) of the title compound as light brown foamy solid.

Example 256C

15 (2-Methyl-3-(carboethoxymethyl)indol-5-yl)[2-trifluoromethyl-4-(E-((morpholin-1-yl)carbonyl)ethenyl) phenyl] sulfide

To a stirred solution of hydrazone (90 mg, 0.15 mmol) in 2 mL of ethanol was  
added levulinic acid (24 mL, 23 mmol) and *p*-TsOH (146 mg, 0.75 mmol). The  
mixture was then refluxed for 2 days. After cooled down to ambient temperature, the  
20 reaction mixture was partitioned between EtOAc and sat. NaHCO<sub>3</sub>. The organic layer  
was then washed with brine, dried over Na<sub>2</sub>SO<sub>4</sub>, concentrated in vacuo. The residue  
was then purified on Gilson preparative HPLC as described in Example 38B to give

Example 310A2,3-Dichloro-4-trifluoromethanesulfonyloxy-benzaldehyde

- 2,3-Dichloro-4-hydroxy-benzaldehyde (9.10 g., J. Med. Chem. 19 (4), 534,  
1994) was dissolved in 45 ml. pyridine at room temperature. The solution was placed  
20 in an ice bath and immediately, 15.63 g. of trifluoromethanesulfonic anhydride was  
added slowly. [Note: If the pyridine solution is cooled to zero before addition of  
triflic anhydride the aldehyde crystallizes out and the mixture cannot be stirred.]

After the addition is complete the dark mixture was stirred for 1 hour at room temperature. It was then poured into a stirred mixture of ice water, 100 ml. of concentrated HCl and ether. [Note: Not everything is soluble in this mixture] The ether layer was separated, dried over sodium sulfate, and the solvent removed. Warm  
5 heptane was added to this residue, and any insoluble material was filtered. The solution was concentrated to give 8.74 g. (57% yield) of product as an orange oil which solidified in the refrigerator.

#### Example 310B

##### 10 2,3-Dichloro-4-(2-methoxyphenylthio)-benzaldehyde

2,3-Dichloro-4-trifluoromethanesulfonyloxy-benzaldehyde (2.50 g.) was dissolved in 6 ml. acetonitrile. 2-Methoxybenzenethiol (2.55 g. of 70% pure material, 50% excess) was added. With cooling 2.50 g. diisopropylethylamine was added slowly. The solution was removed from the ice bath, whereon a solid formed.. The  
15 solution was warmed in a 50C waterbath for 5 minutes. More acetonitrile (5 ml.) was added and the mixture was cooled in ice, and then filtered to get 2.047 g. of product, m.p. 137-139C.

A mixture of 2,3-dichloro-4-(2-methoxyphenylthio)-benzaldehyde (2.03 g.), 1.44 g. malonic acid, 5 ml. pyridine, and 0.100 g piperidine was heated to 115 degrees

for 1.5 hours. The mixture was cooled, and ice and HCl were added. The resulting solid was filtered, washed with water and dissolved in tetrahydrofuran. This solution was dried over sodium sulfate, the solvent removed and ether added to give 1.733 g of product, m.p. 187-188C.

An alternative method for preparing Example 340 is given below.

#### Example 340A

##### 1-Methyl-5-iodoindole

To a solution of 5-iodoindole (75 g, 0.31 mol) in dry THF (750mL), at -78°C was added sodium hydride (60% in mineral oil, 14.85 g, 0.37 mol) in one portion. The suspension was stirred at -78°C for 1 hour after which iodomethane (28.8 mL, 0.46 mol) was added. The reaction mixture was stirred overnight with a slow elevation on temperature to room temperature (no more dry ice was added). Ether (600mL) and hexane (1.2L) were added and the mixture was washed with brine (1.6L) and water (1.5L), dried over Na<sub>2</sub>SO<sub>4</sub> and filtered. The solution was concentrated and the residual brown solid was recrystallized from hexane to give the title compound

(66 g). The impure fraction from the mother liquor was flash chromatographed (8% EtOAc in hexane) to give an additional quantity of desired product (12.5 g, combined yield of 99%). MS (DCI/NH<sub>3</sub>) m/e 258 (M+H)<sup>+</sup>.

Example 340B

1-Methyl-S-triisopropylsilyl-5-indolethiol

Potassium hydride (35% in mineral oil, 12.03 g, 0.105 mol) was charged to a 250 mL RBF and was washed with dry THF (2x50mL). The resultant KH powder was then suspended in dry THF (75 mL), and cooled to 5 °C. Triisopropylsilylthiol (20.0 g, 0.105 mol) was slowly added via syringe over a period of 15 minutes. Vigorous escape of hydrogen gas was observed with addition of the thiol. The suspension was stirred at 5°C for 1 our and became homogenous. After another hour stirring at room temperature, this solution was cannulated to a THF solution (100mL) containing Example 340A (24.5 g, 95.5 mmol) and tetrakis(triphenylphosphine)palladium(0) (2.2 g, 1.91 mmol). The yellow suspension was stirred at 70°C for 1 hour. After cooled, ether and hexane were added, and the mixture was washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated. The residual oil was purified by flash chromatography (silica gel, 3% EtOAc in hexane) to give the title compound (26.7 g, 88%). MS (DCI/NH<sub>3</sub>) m/e 320 (M+H)<sup>+</sup>.

273

Example 340C4-Bromo-2,3-dichlorophenol

To a solution of 2,3-dichlorophenol (200 g, 1.227 mol) in dichloromethane  
5 (800 mL), at 0 °C was added dropwise bromine (196.1g, 1.227 mol) from a dropping  
funnel within 1 hour. The red solution was stirred overnight (0°C - rt), and washed  
with 10% NaHSO<sub>3</sub>. The organic phase was dried over Na<sub>2</sub>SO<sub>4</sub>, and concentrated. The  
residual white solid was recrystallized from hexane to give example 340C as white  
needles (207g, 70%). MS (DCI/NH<sub>3</sub>) *m/e* 241 (M+H)<sup>+</sup>.

10

Example 340DMethyl 2,3-dichloro-4-(4-hydroxyphenyl)acrylate

A 1 L RBF was charged with Example 340C (48.4 g, 0.2 mol), Pd<sub>2</sub>(dba)<sub>3</sub> (4.6  
15 g, 5 mmol), (Tol)<sub>3</sub>P (4.66 g, 15.2 mmol), and purged with nitrogen. Dry DMF (300  
mL), methyl acrylate (51.66 g, 0.6 mol) and triethylamine (84 mL, 0.6 mol) were then  
added. The reaction mixture was purged with nitrogen and stirred at 100°C (oil bath)  
for 16 hours. After cooled to room temperature, a lot of white crystalline material  
formed. Ethyl acetate (500 mL) and brine (not saturated, 800 mL) were added, and  
20 stirred. The white crystalline material dissolved. A little insoluble black solid (Pd)

274

was filtered off. To the solution was then added, with stirring, saturated NaCl solution (2 L) and hexane (500 mL). The mixture was stirred for 1 hour. The formed yellowish solid was collected by filtration, washed with water (400 mL), acetonitrile (50 mL) and 1:1 ethyl acetate/hexane (500 mL), and dried to give pure desired compound (44.99g, 91%). MS (DCI/NH<sub>3</sub>) *m/e* 247 (M+H)<sup>+</sup>.

Example 340E

Methyl 2,3-dichloro-4-(trifluoromethanesulfonyl)phenylacrylate

To a suspension of Example 340D (18.62 g, 75.4 mmol) in pyridine (150 mL) at 5°C was added trifluoromethylsulfonyl anhydride (25.53 g, 90 mmol) very slowly. The suspension was stirred at 5 °C for 1 hour and became homogeneous. The solution was kept at 5 °C for 2 hours and at room temperature for 20 minutes. Ether (700mL) was added and the mixture was washed 10%HCl (700 mL)/brine (300 mL), 10%HCl (100 mL)/brine (900 mL), and brine (500 mL). The organic phase was dried (Na<sub>2</sub>SO<sub>4</sub>) and concentrated to give the title compound (24.86 g, 87%). MS (DCI/NH<sub>3</sub>) *m/e* 379 (M+H)<sup>+</sup>.

### Example 340F

**(1-Methylindol-5-yl)[2,3-dichloro-4-(*E*-(carboxyethenyl)phenyl] sulfide**

To a solution of Example 340B (38.5 g, 0.12 mol) and Example 340E (30.3 g, 0.08 mol) in dry N-methylpyrrolidinone (300 mL) was added CsF (18.2 g, 0.12 mol) at 5°C under nitrogen atmosphere. After 1 hour stirring at the same temperature, the cooling bath was removed, and the mixture was stirred at room temperature for 0.5 hour. Ethyl acetate (800 mL) was added, and the mixture was washed with brine and water, and concentrated. The residual oil was separated by flash chromatography (20% EtOAc/hexane) to give a yellow solid (30 g).

10 This yellow solid was dissolved in THF (150 mL), and was added a solution of  
LiOH (4.0 g, 0.16 mol) in H<sub>2</sub>O (50 mL). The mixture was stirred at room temperature  
for 1 hour and more water (100 mL) was added to form a transparent solution. After  
overnight stirring the solution was acidified with 10 % aq. HCl. The mixture was  
concentrated under reduced pressure to about 100 mL. The formed solid material  
15 was collected by filtration, washed with water (200 mL), acetonitrile (30 mL), 1:1  
ether/hexane, and dried to give the title compound (22.3 g, overall 74%). MS  
(DCI/NH<sub>3</sub>) *m/e* 378 (M+H)<sup>+</sup>.

### Example 340G

276

(1-Methylindol-5-yl)[2,3-dichloro-4-( E-((4-carbomethoxypiperidin-1-yl)carbonyl)ethenyl)phenyl] sulfide

To a solution of Example 340F (9.5 g, 25.1 mmol) and methyl isonipecotate (7.19 g, 50.2 mmol) in DMF (70 mL) was added EDC (9.64 g, 50.2 mmol), HOBt (6.78 g, 50.2 mmol) and triethylamine (7.0 mL, 50.2 mmol). The reaction mixture was stirred at room temperature for 15 hours. Ethyl acetate (800 mL) was added, and the mixture was washed with brine, and concentrated. The residue was purified by flash chromatography (60% EtOAc in hexane) to give example 340G as white powder (10.86 g, 94%). MS (ESI<sup>+</sup>) *m/z* 503 (M+H)<sup>+</sup>.

Example 340

(1-Methylindol-5-yl)[2,3-dichloro-4-( E-((4-carboxypiperidin-1-yl)carbonyl)ethenyl)phenyl] sulfide, sodium salt

To a suspension of Example 340G (11.8 g, 23.6 mmol) in THF (150 mL) was added a solution of lithium hydroxide monohydrate (1.98 g, 47.2 mmol) in H<sub>2</sub>O (30 mL). The mixture was stirred at room temperature overnight. Water (120 mL) was added and formed transparent solution was stirred for another hour before 10% HCl (30 mL) was added. The mixture was concentrated under reduced pressure to about 120 mL. The formed solid material was collected by filtration, washed with water, acetonitrile, and dried to give a white solid (11.0 g).

10.50 grams of the solid was suspended in methanol (60 mL), and was treated with a solution NaOH (0.859g) in methanol (20 mL). After all of the solid material went into solution, the solvent was removed under reduced pressure. The residual yellow oil was triturated with ether, and dried to give the title compound as yellow powder (11.33 g, 95%).

#### Example 359A

##### 1-Methyl-2,3-bis(trifluoromethyl)-7-oxabicyclo[2.2.1]hepta-2,5-diene

Hexafluoro-2-butyne (21.0 g, 0.13 mol) was transferred into a reaction bottle and added 2-methylfuran (12.86 g, 0.157 mol). This resulting mixture bottle was sealed and heated for 15 hr. at 120 °C. After cooling, the excess 2-methylfuran was rotoevaporated in vacuo at rt, to give crude title product (29 g, 92%), which was used directly.

#### Example 359B

##### 4-Methyl-2,3-bis(trifluoromethyl)phenol

A mixture of Example 359A (12.0 g, 0.05 mol) and boron trifluoride-diethyl ether complex (150 ml) was stirred at room temp overnight, then neutralized carefully with 20% aqueous potassium carbonate, then the mixture was extracted with ether. The ether layer was dried over  $\text{MgSO}_4$  and evaporated under reduced pressure to  
5 afford 10.4g (85%) of the title compound.

#### Example 359C

##### 4-[4-Bromobenzene sulfonyloxy-2,3-bis(trifluoromethyl)]benzylbromide

The phenol compound of Example 359B (10 g, 0.04 mol) was treated with 4-  
10 bromobenzenesulfonyl chloride (11.0 g, 0.043 mol) and Hunig's base (5.56 g, 0.043 mol) in  $\text{CH}_2\text{Cl}_2$  (150 ml). The solution was washed with water, brine and dried over  $\text{MgSO}_4$ . After evaporating the solvent, N-bromosuccinimide (7.3 g, 0.04 mol) and benzoyl peroxide (200 mg) were added and the mixture was suspended in  $\text{CCl}_4$  (100ml). The resulting mixture was refluxed for 13 hr. When the reaction was  
15 cooled, the white solid was filtered and washed with  $\text{CCl}_4$  to afford the crude title compound. This crude product was used for next step without further purification.

#### Example 359D

##### 4-Hydroxy-2,3-bis(trifluoromethyl)benzaldehyde

20 The crude product of Example 359C was dissolved in 60 ml of DMSO and 20 ml of  $\text{CH}_2\text{Cl}_2$ , and 12 g of trimethylamine N-oxide added. The resulting mixture was stirred at rt for 2.5 hr. The reaction mixture was poured into an ice cold 50% saturated

aqueous NaCl solution (200 ml) and extracted with ether (3X100 ml). The combined organic layer was washed with brine and dried over Na<sub>2</sub>SO<sub>4</sub>. After evaporation of solvent, the product was purified by column chromatography, eluted with hexane:EtOAc (3:2) to provide 3.0 g of the title compound, plus 4.0 g of recovered 4-[4-bromobenzenesulfonyloxy-2,3-bis(trifluoromethyl)]toluene.

Example 384E

[3-(4-Morpholino)phenyl] [2,3-dichloro-4-(E-[(4-carboxypiperidin-1-yl)carbonyl]ethenyl)phenyl] sulfide

- 5           Using the procedure of Example 340H, Example 384D is hydrolyzed to the title compound.

Compounds that antagonize the interaction between ICAM-1 and LFA-1 can be identified, and their activities quantitated, using both biochemical and cell-based  
10   adhesion assays. A primary biochemical assay measures the ability of the compound in question to block the interaction between the integrin LFA-1 and its adhesion partner ICAM-1, as described below:

ICAM-1 / LFA-1 Biochemical Interaction Assay

- 15           In the biochemical assay, 100  $\mu$ L of anti-LFA-1 antibody (ICOS Corporation) at a concentration of 5  $\mu$ g/ml in Dulbecco's phosphate-buffered saline (D-PBS) is used to coat wells of a 96-well microtiter plate overnight at 4°C. The wells are then washed twice with wash buffer (D-PBS w/o  $\text{Ca}^{++}$  or  $\text{Mg}^{++}$ , 0.05% Tween 20) and blocked by addition of 200  $\mu$ L of D-PBS, 5% fish skin gelatin. Recombinant LFA-1  
20   (100  $\mu$ L of 0.7  $\mu$ g/ml, ICOS Corporation) in D-PBS is then added to each well. Incubation continues for 1 hour at room temperature and the wells are washed twice

with wash buffer. Serial dilutions of compounds being assayed as ICAM-1/LFA-1 antagonists, prepared as 10 mM stock solutions in dimethyl sulfoxide (DMSO), are diluted in D-PBS, 2mM MgCl<sub>2</sub>, 1% fish skin gelatin and 50 µL of each dilution added to duplicate wells. This is followed by addition of 50 µL of 0.8 µg/ml biotinylated  
5 recombinant ICAM-1/Ig (ICOS Corporation) to the wells and the plates are incubated at room temperature for 1 hour. The wells are then washed twice with wash buffer and 100 µL of Europium-labeled Streptavidin (Wallac Oy) diluted 1:100 in Delfia assay buffer (Wallac Oy) are added to the wells. Incubation proceeds for 1 hour at room temperature. The wells are washed eight times with wash buffer and 100 µL of  
10 enhancement solution (Wallac Oy, cat. No. 1244-105) are added to each well. Incubation proceeds for 5 minutes with constant mixing. Time-resolved fluorimetry measurements are made using the Victor 1420 Multilabel Counter (Wallac Oy) and the percent inhibition of each candidate compound is calculated using the following equation:

15

$$\% \text{ inhibition} = 100 \times \left\{ 1 - \frac{\text{average OD w/ compound minus background}}{\text{average OD w/o compound minus background}} \right\}$$

where "background" refers to wells that are not coated with anti-LFA-1 antibody.

20

Compounds of the present invention exhibit inhibitory activity in the above assay as follows:

Biologically relevant activity of the compounds in this invention is confirmed using a cell-based adhesion assay, which measures their ability to block the adherence of JY-8 cells (a human EBV-transformed B cell line expressing LFA-1 on its surface) to immobilized ICAM-1, as follows:

ICAM-1 / JY-8 cell adhesion assay

For measurement of inhibitory activity in the cell-based adhesion assay, 96-well microtiter plates are coated with 70  $\mu$ L of recombinant ICAM-1/Ig (ICOS Corporation) at a concentration of 5  $\mu$ g/mL in D-PBS w/o  $\text{Ca}^{++}$  or  $\text{Mg}^{++}$  overnight at 4°C. The wells are then washed twice with D-PBS and blocked by addition of 200  $\mu$ L of D-PBS, 5% fish skin gelatin by incubation for 1 hour at room temperature. Fluorescent tagged JY-8 cells (a human EBV-transformed B cell line expressing LFA-1 on its surface; 50  $\mu$ L at  $2 \times 10^6$  cells/ml in RPMI 1640/1% fetal bovine serum) are added to the wells. For fluorescent labeling of JY-8 cells, 5  $\times 10^6$  cells washed once in RPMI 1640 are resuspended in 1 mL of RPMI 1640 containing 2  $\mu$ M Calcein AM (MolecularProbes), are incubated at 37°C for 30 minutes and

washed once with RPMI-1640/ 1% fetal bovine serum. Dilutions of compounds to be assayed for ICAM-1/LFA-1 antagonistic activity are prepared in RPMI-1640/ 1% fetal bovine serum from 10mM stock solutions in DMSO and 50  $\mu$ L are added to duplicate wells. Microtiter plates are incubated for 45 minutes at room temperature and the wells are washed gently once with RPMI-1640/ 1% fetal bovine serum. Fluorescent intensity is measured in a fluorescent plate reader with an excitation wavelength at 485 nM and an emission wavelength at 530 nM. The percent inhibition of a candidate compound at a given concentration is calculated using the following equation:

10

$$\% \text{ inhibition} = 100 \times \left\{ 1 - \frac{\text{average OD w/ compound}}{\text{average OD w/o compound}} \right\}$$

and these concentration/inhibition data are used to generate dose response curves, from which  $IC_{50}$  values are derived.

Compounds of the present invention exhibit blocking activity in the above assay as

follows:

Compounds of the present invention have been demonstrated to act via interaction with the integrin LFA-1, specifically by binding to the interaction domain (I-domain), which is known to be critical for the adhesion of LFA-1 to a variety of cell adhesion molecules. As such, it is expected that these compounds should block the interaction of LFA-1 with other CAM's. This has in fact been demonstrated for the case of ICAM-3. Compounds of the present invention may be evaluated for their ability to block the adhesion of JY-8 cells (a human EBV-transformed B cell line expressing LFA-1 on its surface) to immobilized ICAM-3, as follows:

#### ICAM-3 / JY-8 cell adhesion assay

For measurement of inhibitory activity in the cell-based adhesion assay, 96-well microtiter plates are coated with 50  $\mu$ L of recombinant ICAM-3/Ig (ICOS Corporation) at a concentration of 10  $\mu$ g/mL in D-PBS w/o  $\text{Ca}^{++}$  or  $\text{Mg}^{++}$  overnight at 4°C. The wells are then washed twice with D-PBS, blocked by addition of 100  $\mu$ L of D-PBS, 1% bovine serum albumin (BSA) by incubation for 1 hour at room temperature, and washed once with RPMI-1640 / 5% heat-inactivated fetal bovine serum (adhesion buffer). Dilutions of compounds to be assayed for ICAM-3/LFA-1 antagonistic activity are prepared in adhesion buffer from 10 mM stock solutions in DMSO and 100  $\mu$ L are added to duplicate wells. JY-8 cells (a human EBV-

transformed B cell line expressing LFA-1 on its surface; 100  $\mu$ L at  $0.75 \times 10^6$  cells/ml in adhesion buffer) are then added to the wells. Microtiter plates are incubated for 30 minutes at room temperature; the adherent cells are then fixed with 50  $\mu$ L of 14% glutaraldehyde/D-PBS and incubated for an additional 90 minutes.

- 5 The wells are washed gently with dH<sub>2</sub>O; 50  $\mu$ L of dH<sub>2</sub>O is added, followed by 50  $\mu$ L of 1% crystal violet. After 5 minutes the plates are washed 3X with dH<sub>2</sub>O; 75  $\mu$ L of dH<sub>2</sub>O and 225  $\mu$ L of 95% EtOH are added to each well to extract the crystal violet from the cells. Absorbance is measured at 570 nm in an ELISA plate reader. The percent inhibition of a candidate compound is calculated using the following
- 10 equation:

$$\% \text{ inhibition} = 100 \times \left\{ 1 - \frac{\text{average OD w/ compound}}{\text{average OD w/o compound}} \right\}$$

Compounds of the present invention exhibit blocking activity in the above assay as follows:

20 14. A compound according to Claim 1 wherein Ar is selected from the group  
consisting of methoxyphenyl and isopropylphenyl.

15. A compound according to Claim 1 wherein Ar is benzodioxan or substituted benzodioxan.
16. A compound according to Claim 1 wherein R<sub>3</sub> is a "trans-cinnamide"; and Ar is  
5 selected from 1,3-benzimidazol-2-one, 1,4-benzodioxane, 1,3-benzodioxole, 1-benzopyr-2-en-4-one, indole, isatin, phenyl, 1,3-quinazolin-4-one, and quinoline.
17. A compound according to Claim 1 wherein R<sub>10</sub> and R<sub>11</sub> are independently selected from hydrogen, alkyl, cycloalkyl, alkoxycarbonylalkyl, hydroxyalkyl, and  
10 heterocyclalkyl.
18. A compound according to Claim 1 wherein NR<sub>10</sub>R<sub>11</sub> is heterocycl or substituted heterocycl.
- 15 19. A pharmaceutical composition comprising a compound of Claim 1 in a pharmaceutically-acceptable carrier.
20. A method of inhibiting inflammation comprising the administration of a compound of Claim 1 to a mammal in need of treatment.  
20
21. A method of inhibiting inflammation comprising the administration of a composition of Claim 12 to a mammal in need of treatment.

22. A method of suppressing immune response comprising the administration of a compound of Claim 1 to a mammal in need of treatment.
- 5 23. A method of suppressing immune response comprising the administration of a composition of Claim 12 to a mammal in need of treatment.
24. A process for preparing a compound of Claim 1
