Abstract

MULTI-ENZYME SYSTEM FOR FEEDS CONTAINING CASSAVA

A new multi-enzyme product KEMZYME TOP Dry has been formulated to improve the nutritive value of cassava or tapioca (*Manihot esculenta* Crantz), a common crop in Asia and Africa for food and feed. This product contains a unique combination of three starch hydrolyzing enzymes to increase hydrolysis of cassava starch. *In vitro* experiments confirmed that KEMZYME TOP Dry is superior to commercial enzymes for corn soybean diets in the release of reducing sugar from cassava. KEMZYME TOP Dry is therefore suitable for use in feed containing alternative feed ingredients with high starch content.
