performing robotic process automation and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for performing robotic process automation and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for performing robotic process automation and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for performing robotic process automation and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for performing robotic process automation and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for performing robotic process automation and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for performing robotic process automation and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1589] In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a machine learning and/or artificial intelligence system for categorizing employees. In embodiments, provided herein is an enterprise management platform having a machine learning

and/or artificial intelligence system for detecting market behavior and having a machine learning/artificial intelligence system for market pricing forecasting. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having an AI-driven prospect targeting system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a digital twin environment simulation system for simulating different parameters of an environment. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation. In embodiments, provided herein is an enterprise management platform having a machine learning

and/or artificial intelligence system for detecting market behavior and having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting

market behavior and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management

platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise

management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain

entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data

from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments,

provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters

of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system

for detecting market behavior and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a

set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for detecting market behavior and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1590] In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit. In embodiments, provided herein is an enterprise

management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a machine learning and/or artificial intelligence system for categorizing employees. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a machine learning/artificial intelligence system for market pricing forecasting. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having an AI-driven prospect targeting system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a digital twin environment simulation system for simulating different parameters of an environment. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having enterprise digital twins wherein the configuration of each type of enterprise digital

twin is predefined with default digital twin data types and default granularities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine,

factory, or business unit and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a digital twin

system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a quantum annealing computing system for

optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a management platform with a user interface that provides a unified set of Internet of Things systems

that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform

having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect

to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a value chain network management platform having a set of microservices for managing a

set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for learning on a

training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In

embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced

by a machine, factory, or business unit and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that

can be produced by a machine, factory, or business unit and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system

configured to determine possible outputs that can be produced by a machine, factory, or business unit and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1591] In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a machine learning/artificial intelligence system for market pricing forecasting. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having an AI-driven prospect targeting system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a digital twin environment simulation system for simulating different parameters of an environment. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having enterprise digital twins

wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a digital twin system having a mixed reality visual interface for an enterprise digital twin.

In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a machine learning

and/or artificial intelligence system for categorizing employees and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a management platform with a user interface that provides a unified set of data collection systems that support a

set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and

having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and

a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating,

modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of adaptive intelligent systems operating within a value chain network management platform for

providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a

machine learning and/or artificial intelligence system for categorizing employees and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having

a machine learning and/or artificial intelligence system for categorizing employees and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system for categorizing employees and

having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1592] In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having an AI-driven prospect targeting system. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a digital twin environment simulation system for simulating different parameters of an environment. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a playback interface for an enterprise digital twin wherein a user may replay

data for a situation in the enterprise digital twin and observe visual representations of events related to the situation. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having an executive digital twin having a system for automatically

highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a predictive model communication protocol (PMCP) for facilitating

change-based communication. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments,

provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a dashboard for managing a set of digital twins, wherein at least one digital twin

represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a

digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management

platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In

embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for configuring a set of policies within a value chain network management platform and for

automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments,

provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning/artificial intelligence system for market pricing forecasting and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1593] In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having an AI-driven prospect targeting system. In embodiments, provided herein is an enterprise management

platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a digital twin environment simulation system for simulating different parameters of an environment. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments,

provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset,

or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial

intelligence system to increase the efficiency of an enterprise and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of supply chain applications for management of a

set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and

workflows. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin

that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In

embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of artificial intelligence systems and a set of digital twins of a set

of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of

products of an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant

to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a machine learning and/or artificial intelligence system to increase the efficiency of an enterprise and having a system for automatically managing a set of autonomous vehicles to undertake a set

of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1594] In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a digital twin environment simulation system for simulating different parameters of an environment. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for providing an Enterprise

Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect

targeting system and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain

information for a category of goods. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status

information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes

and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a value chain network management platform having a kit system for

providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect

targeting system and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise.

In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set

of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an AI-driven prospect targeting system and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1595] In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a digital twin environment simulation system for simulating

different parameters of an environment. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital

twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a collaboration suite

configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital

twins for depicting one or more aspects of an organization, either visually or in a data representation and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a management platform with a user interface

that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital

twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform

having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a value chain network management platform having a set of microservices for managing a set of value chain network

entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of

an organization, either visually or in a data representation and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated

coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management

platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is

an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a set of intelligent systems in a value chain network management platform for configuring

and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin system having enterprise digital twins for depicting one or more aspects of an organization, either visually or in a data representation and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1596] In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a digital twin environment simulation system for simulating different parameters of an environment. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having enterprise digital

twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the

one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a digital twin system

having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a smart

enterprise wallet. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a quantum computing system for calculating a starting point for

modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a management platform with a user interface that provides a

unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more

segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization,

where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a machine learning/artificial intelligence system configured to generate recommendations for placing an

additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an

enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization,

where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-

based digital twin are tailored to a particular role within an organization and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for

representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities

in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the

granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented

by the role-based digital twin are tailored to a particular role within an organization and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having one or more role-based digital twins for representing one or more segments/aspects of an organization, where the one or more segments/aspects and/or the granularity of the data represented by the role-based digital twin are tailored to a particular role within an organization and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1597] In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a digital twin environment simulation system for simulating different parameters of an environment. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to

the situation. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided

herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin.

In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related

to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise

environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a

set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of

situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of

situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network

connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one

of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of

intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having at least

one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of

adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise

environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain

network management platform. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a situational database in which attributes of a set of situations related to enterprise environments are characterized and stored for access by a set of intelligent systems, wherein identifying information for the situations is configured to be accessed from an enterprise digital twin and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1598] In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having

a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different

parameters of an environment and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a digital twin

environment simulation system for simulating different parameters of an environment and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform

having a digital twin environment simulation system for simulating different parameters of an environment and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand

management entities. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In

embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a cloud-based value chain network

management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information

collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin

environment simulation system for simulating different parameters of an environment and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform

having a digital twin environment simulation system for simulating different parameters of an environment and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin environment simulation system for simulating different parameters of an environment and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1599] In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins. In embodiments, provided herein is an enterprise

management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having

enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform

having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a quantum computing system for calculating a starting point for modeling on a classic computer. In

embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is

predefined with default digital twin data types and default granularities and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing

information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default

granularities and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having enterprise digital

twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine

learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of

each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a digital twin

representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital

twin is predefined with default digital twin data types and default granularities and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein the

configuration of each type of enterprise digital twin is predefined with default digital twin data types and default granularities and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1600] In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is

enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset,

or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the

granularities of the different types of enterprise digital twins and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for integrating with a social media system. In embodiments, provided herein is an

enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a management

platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and

having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different

types of enterprise digital twins and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having enterprise digital

twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of

enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of

enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise

management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different

types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the

different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having enterprise digital twins wherein a user is enabled to define the types of data depicted in the different types of enterprise digital twins and/or the granularities of the different types of enterprise digital twins and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1601] In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having a

playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data

for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a vector module configured to vectorize received data. In embodiments,

provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and

having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a management

platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of microservices layers including

an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a machine learning/artificial

intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual

representations of events related to the situation and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set

of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management

application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand

management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital

twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual

representations of events related to the situation and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a playback interface for an enterprise digital twin wherein a user may replay data for a situation in the enterprise digital twin and observe visual representations of events related to the situation and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1602] In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for representing financial characteristics of enterprise assets in an executive

digital twin. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface

to an enterprise environment for third parties based on levels of authorization and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a quantum computing

system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a projected enterprise

digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain

entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a projected enterprise

digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a value chain network

management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise

environment for third parties based on levels of authorization and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a projected enterprise

digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having set of intelligent systems for populating a digital twin of a warehouse

based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management

platform. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a projected enterprise digital twin for providing a regulated interface to an enterprise environment for third parties based on levels of authorization and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1603] In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an

enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics

represent correlations of digital twin asset data with a set of financial outcomes and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for

set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a system for providing a set of

analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where

the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a

set of financial outcomes and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a machine

learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset

data with a set of financial outcomes and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network

entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an

enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for

an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of

digital twin asset data with a set of financial outcomes and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for selecting and configuring a data architecture among a set of available data architectures to

enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing a set of analytics for set of assets in an enterprise digital twin, where the analytics represent correlations of digital twin asset data with a set of financial outcomes and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1604] In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a digital twin system having a system for taking a set of data and for

automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a quantum

computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing

an Enterprise Digital Twin as a Service and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set

of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital

Twin as a Service and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for learning on a training set of repair outcomes, parameters, and data collected

from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of adaptive intelligent

systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities

to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein

is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for providing an Enterprise Digital Twin as a Service and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1605] In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided

herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a vector module configured to vectorize received data. In

embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a management platform with a user

interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of

supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features

using genetic programming with user feedback and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user

feedback and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine

learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an

enterprise. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments,

provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet

entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for variation and selection of digital twin interface features using genetic programming with user feedback and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1606] In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for representing financial characteristics of

enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of

adaptive edge computing systems with an enterprise digital twin and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a system for

integrating a set of adaptive edge computing systems with an enterprise digital twin and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of

adaptive edge computing systems with an enterprise digital twin and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that

provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided

herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial

intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a

system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having set of intelligent systems for populating a digital twin of a

warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain

network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating a set of adaptive edge computing systems with an enterprise digital twin and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1607] In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments,

provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin

and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management

platform having a system for embedding a smart contract in an enterprise digital twin and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments,

provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin

and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management

platform having a system for embedding a smart contract in an enterprise digital twin and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain

network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand

management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of

intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for embedding a smart contract in an enterprise digital twin and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1608] In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for locking an

enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are

not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a management platform

with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an

enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a machine

learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a value chain network management platform having a kit system for providing out-of-the-

box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the

artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise

workflows in an enterprise digital twin and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of intelligent systems for automatically

populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing enterprise workflows in an enterprise digital twin and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1609] In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a

system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets

in an executive digital twin and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a management platform with a user interface that provides a set of unified views for a set of demand management information and

supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain

project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of

enterprise assets in an executive digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a value chain network management platform having a set of microservices for

managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform

having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of adaptive intelligent systems operating on information collected and managed

in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise

management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital

twin and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for representing financial characteristics of enterprise assets in an executive digital twin and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1610] In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable

the digital twin. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for

integrating an enterprise digital twin with a risk management system and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a management platform with a user interface that provides a

unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data

collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point

of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network

entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for

integrating an enterprise digital twin with a risk management system and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for

an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for

integrating an enterprise digital twin with a risk management system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating an enterprise digital twin with a risk management system and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1611] In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a digital twin system having an in-twin marketplace system. In

embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual

interface for an enterprise digital twin and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system

having a mixed reality visual interface for an enterprise digital twin and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain

entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value

chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin

that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of artificial intelligence

systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of

products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided

herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a mixed reality visual interface for an enterprise digital twin and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1612] In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon

detection of a suspicious condition and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a management platform with a user interface that provides a unified set of data collection

systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system

for locking an enterprise digital twin upon detection of a suspicious condition and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation

processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a value chain network management platform having a set of microservices for managing a set of value chain

network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin

upon detection of a suspicious condition and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain

for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain

network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise

management platform having a system for locking an enterprise digital twin upon detection of a suspicious condition and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1613] In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and

having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is

an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a management platform with a set of facilities that provide automated recommendations for a set of value chain

process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an

enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent

a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention

and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for

automatically highlighting assets for attention and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of

features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having an executive digital

twin having a system for automatically highlighting assets for attention and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an executive digital twin having a system for automatically highlighting assets for attention and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1614] In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided

herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a management platform with a user interface that provides a unified set of data

collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing

instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a digital twin system

having an in-twin marketplace system and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital

twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments,

provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a

digital twin system having an in-twin marketplace system and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments,

provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin marketplace system and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1615] In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided

herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having an information filtering system

for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a quantum database engine. In embodiments, provided herein is an

enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for

taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the

impact of the data in a set of dynamic models that are used to enable the digital twin and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset,

or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In

embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital

twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating

to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set

of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system

having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish

connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a system for managing connectivity between a value

chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having a system for taking a set of data and for automatically depicting a set of features of a digital twin of an enterprise component, entity, asset, or facility based on the impact of the data in a set of dynamic models that are used to enable the digital twin and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1616] In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and

having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that

controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate

and interact with the executive digital twin in a digital environment and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a

digital environment and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect

to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and

monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with

the executive digital twin in a digital environment and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a system for learning on a training set of reverse

logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of adaptive intelligent systems operating on information

collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple

disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive

digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that

controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a collaboration suite configured to allow multiple disparate users authorized by an enterprise that controls an executive digital twin to collaborate and interact with the executive digital twin in a digital environment and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1617] In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference

optimization system and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a management platform with a user interface that provides a

unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a management platform with a set of facilities that provide automated recommendations for

a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data

collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a value chain network management platform having a set of microservices for managing a set of value chain network

entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of

value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a

demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer

goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management

platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a digital twin system having an in-twin video conferencing system having an AI-enhanced video conference optimization system and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1618] In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a smart

enterprise wallet. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a management platform with a user interface that provides a unified set of data

collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an

enterprise management platform having an intelligent executive agent system and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value

chain entities. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a system for learning on a training set of

machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value

chain network management platform. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having set of intelligent systems for populating a digital twin of a warehouse based on information collected

about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a system for

discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an intelligent executive agent system and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1619] In embodiments, provided herein is an enterprise management platform having a sensor fusion system. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having

a sensor fusion system and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a management platform with a set of project management facilities that

provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In

embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of

creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with

parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for

an enterprise. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In

embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a sensor fusion system and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1620] In embodiments, provided herein is an enterprise management platform having AI-guided field experts. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having

AI-guided field experts and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand

management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of microservices layers including an application layer supporting at least one supply chain application

and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein

is an enterprise management platform having AI-guided field experts and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain

network entities and activities. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain

network entities. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data

collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having AI-guided field experts and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1621] In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided

herein is an enterprise management platform having a smart enterprise wallet and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In

embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with

respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a value chain network

management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise

management platform having a smart enterprise wallet and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In

embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on

information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a smart enterprise wallet and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1622] In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only

when necessary to a user and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a

category of goods. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a management platform with a set of project management facilities that provide automated recommendations for a set of

value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of microservices layers including an application layer supporting at least one supply chain

application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided

herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating

to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an

enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify

inputs, and/or to provide outputs only when necessary to a user and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only

when necessary to a user and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only

when necessary to a user and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a data stream module configured to ignore data streams and inputs according to context, to simplify inputs, and/or to provide outputs only when necessary to a user and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1623] In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize

received data and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide

coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In

embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In

embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and

having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a vector module

configured to vectorize received data and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is

an enterprise management platform having a vector module configured to vectorize received data and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a vector module configured to vectorize received data and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1624] In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a system for integrating with a social media system. In embodiments,

provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data

and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the

central control system are not overwhelmed with a high volume of data and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience

processing engine and the central control system are not overwhelmed with a high volume of data and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform.

In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform

having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is

an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a system for configuring a set of policies within a value chain network management platform and for

automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments,

provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In

embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having an information filtering system for controlling and regulating communication such that the semi-sentience processing engine and the central control system are not overwhelmed with a high volume of data and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1625] In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a predictive

model communication protocol (PMCP) for facilitating change-based communication and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence

for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of microservices layers including an application layer supporting

at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a value chain network management platform having a set of microservices for managing a set of value

chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a predictive model communication

protocol (PMCP) for facilitating change-based communication and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of adaptive intelligent

systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network

management platform. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management

platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a predictive model communication protocol (PMCP) for facilitating change-based communication and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1626] In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise

and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise

management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform

having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a value chain network management platform having a set of microservices

for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a system for learning on a training set of repair outcomes, parameters,

and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management

platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In

embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a system for managing connectivity between a value chain management platform and

a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for optimizing one or more aspects of an enterprise and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1627] In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain

information for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and

a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of microservices layers including an

application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain

network entities in the platform. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a system for learning on a training set of logistics outcomes, parameters, and data

collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more

aspects of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a

delivery system. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for

optimizing one or more aspects of an enterprise and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum annealing computing system for optimizing one or more aspects of an enterprise and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1628] In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is

an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a management platform with a set of facilities that provide automated recommendations for a set of

value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an

enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using

a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a

starting point for modeling on a classic computer and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an

enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a

system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a system for discovering in a network of entities a set of value chain network entities based

on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for calculating a starting point for modeling on a classic computer and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1629] In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of

supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for

a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform

having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a value chain network

management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a

set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In

embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments,

provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container

ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting to run a model on a quantum computing system or classic computing system and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1630] In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain

applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a management platform with a set of facilities that provide

automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an

enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a

digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from

solutions of multiple neural networks and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a quantum

computing system for selecting a solution from solutions of multiple neural networks and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a system for generating a digital twin of a product, wherein

the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments,

provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum computing system for selecting a solution from solutions of multiple neural networks and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1631] In embodiments, provided herein is an enterprise management platform having a quantum database engine. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge

computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to

supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network

entities. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically

handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a quantum database

engine and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow

of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a quantum database engine and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1632] In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social

media system and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for

a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation

processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network

entities. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of artificial intelligence systems and a set of digital twins of a set

of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern

operation of a set of value chain network entities. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a

value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an enterprise management platform having a system for integrating with a social media system and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1633] In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain

information for a category of goods and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand

management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand

management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset

among the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand

management information and supply chain information for a category of goods and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information

for a category of goods and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface

that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information

technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by

a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1634] In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods

and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a set of facilities that provide automated recommendations

for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides

a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods

and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value

chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems

interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain

applications for a category of goods and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a

management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a

set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified database that supports a set of demand management applications and a set of supply chain applications for a category of goods and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1635] In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform

with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In

embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and

a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods

and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a system for

learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems

that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin of a customer

of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system

having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and

a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of data collection systems that support a set of demand management applications and a set of supply chain applications for a category of goods and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1636] In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods.

In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide

coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network

entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand

management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set

of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a

set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a

management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In

embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things

systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1637] In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for

a category of goods. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of microservices

layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand

management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a value chain network management platform having a set of microservices for managing a set of value

chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources

related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and

a digital twin system, wherein the machine vision system feeds data to the digital twin system and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital

twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of supply chain

applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine

vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of supply chain applications for management of a set of demand management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1638] In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management

platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain

applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at

least a subset of the applications. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform

with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically

managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a management platform with a user interface

that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a

management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an

information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain

network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that

provides a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1639] In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments,

provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect

to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management

application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for

a category of goods and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain

network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and

managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about

a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category

of goods and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an

information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of robotic process automation systems that provide coordinated automation of a set of demand management applications and a set of supply chain applications for a category of goods and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1640] In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an information

technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand

management entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for

managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for

learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain

network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value

chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain

network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for

automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a

management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a user interface that provides a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1641] In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a dashboard for managing a set of

digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and

demand management entities. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project

management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a set of

project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a set of project

management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an

information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and

a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having

a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for managing a set of

shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project

management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1642] In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of

services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology

system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities

in the platform. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide

automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of

value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent

systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process

tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having

a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing

current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform with a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications and a set of supply chain applications for a category of goods and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1643] In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of microservices layers including an application layer

supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a management platform

for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes

in the value chain network based on current status information for the value chain network and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology

system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network

based on current status information for the value chain network and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on

current status information for the value chain network and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value

chain network based on current status information for the value chain network and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein

a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network and having a system

for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1644] In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an

information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a dashboard

for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform

stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and

having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having

a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having set of intelligent systems for populating a digital twin of a warehouse based on information

collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of intelligent systems for managing a set of shipping infrastructure

entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain

entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1645] In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply

chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a value chain

network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data

collection services, and data storage services and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and

data storage services and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing

services, data collection services, and data storage services and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of

an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting

at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein

the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information

technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1646] In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of microservices layers including an application layer supporting at least one supply chain application

and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a

process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice

layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics

tasks. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect

information with respect to supply chain entities and demand management entities and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set

of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application,

wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments,

provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information

technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1647] In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection

layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the

microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for

at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a system for learning

on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a set

of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In

embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a

set of products for an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise,

wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and

having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities and having a system for automatically managing a

set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1648] In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one

supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a value chain network management platform having a set of microservices for

managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set

of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a

set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems

operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a digital twin

representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand

management entities and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice

layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing

resources that provide information with respect to supply chain entities and demand management entities and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1649] In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an

enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin

that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the

microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers

include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application

layer to automate a set of actions for at least a subset of the applications and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of microservices

layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes

and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a set of intelligent systems for

automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein

the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a robotic process automation processing layer that uses information collected by a data collection layer and a set of outcomes and activities involving the applications of the application layer to automate a set of actions for at least a subset of the applications and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1650] In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and

wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations
