for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a

digital twin that represents a set of value chain entities and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value

chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by

the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an

additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera

feeds into a digital twin that represents a set of value chain entities and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or

in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1651] In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process

management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an

enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services

architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information

about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of

an enterprise. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having set of intelligent systems for populating a digital

twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of

applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of

value chain network entities from a point of origin to a point of customer use and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based management platform with a micro-services architecture and having a set of user interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities and having a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1652] In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of

microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value

chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a

value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable

management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information

collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having

an asset management application of the platform for managing an asset among the value chain network entities and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a set of

intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having an asset management application of the platform for managing an asset among the value chain network entities and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1653] In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a value chain network management platform

having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance.

In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system

having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain

for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a

process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain

network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a system for selecting and configuring a data architecture among a set of available data

architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a process management application of the platform for managing a set of processes and workflows involving the value chain network entities and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1654] In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In

embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of adaptive intelligent systems operating

within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of adaptive intelligent systems operating on information collected

and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an

information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system

having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value

chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of value chain network entities in the platform and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1655] In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a

set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set

of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network

management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of

intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information

technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a value chain network management platform

having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and using a digital twin to represent a set of product demand parameters for a set of related value chain network entities in the platform and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1656] In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of

value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically

handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network

management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value

chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of

value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network

entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a system for selecting and configuring a data architecture among a set of

available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a set of microservices for managing a set of value chain network entities for an enterprise and having a set of processing capabilities for at least one of creating, modifying, and managing the parameters of a digital twin that is used in the platform to represent a set of value chain network entities and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1657] In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents

a set of value chain network entities and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set

of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents

a set of value chain network entities and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value

chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology

system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a value chain network management platform having a kit system for providing out-of-the-box, self-configuring capabilities for a digital twin that represents a set of value chain network entities and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1658] In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a system for

testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an

information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and

having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of intelligent systems for automatically populating attributes of a

digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for testing compatibility or configuration of a set of value chain network entities involved in a value chain for a set of products of an enterprise and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1659] In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial

intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of

artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a system for learning on a training set of

machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain

network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data

collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes,

parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of machine outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to perform stress tests on a set of value chain network entities and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1660] In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a system for learning on a training

set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a set of adaptive intelligent systems

operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set

of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain

network entities and activities and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and

activities and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a cloud-based value chain network management platform having a set of adaptive intelligence facilities for automatically managing a set of incidents relating to a set of value chain network entities and activities and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1661] In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain

entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of adaptive intelligent systems operating on information

collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and

activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a system for generating

a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train

an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of repair outcomes, parameters, and data collected from data sources related to a set of value chain entities and activities to train an artificial intelligence/machine learning system to predict when a set of value chain network entities should receive maintenance and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1662] In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities

to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network

management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a

set of value chain network logistics tasks and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for

managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics

tasks and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network logistics tasks and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1663] In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of adaptive intelligent systems operating within a value chain

network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In

embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically

handle a set of value chain network reverse logistics tasks and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish

connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources

relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for learning on a training set of reverse logistics outcomes, parameters, and data collected from data sources relating to a set of value chain network entities and activities to train an artificial intelligence/machine learning system to automatically handle a set of value chain network reverse logistics tasks and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1664] In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application

based on information collected about a set of value chain network entities and activities and having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste

management application based on information collected about a set of value chain network entities and activities and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information

collected about a set of value chain network entities and activities and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing

instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a

value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating within a value chain network management platform for providing instructions to a waste management application based on information collected about a set of value chain network entities and activities and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1665] In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments,

provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is

an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a system for generating a digital twin of a set of

workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a system for discovering in a network of entities a set of value chain network entities based

on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems and a set of digital twins of a set of value chain network entities, wherein the artificial intelligence systems interact with parameters of the digital twins to support a set of value chain network management platform applications and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1666] In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a

monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable

automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology

system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value

chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of artificial intelligence systems operating on information from a monitoring a set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1667] In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information

technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain

network entities based on information collected and managed in a value chain network management platform and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented

reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a set of intelligent systems in a value chain network management platform for

configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having at least one of a virtual reality, augmented reality and mixed reality system for visualizing information about a set of value chain network entities based on information collected and managed in a value chain network management platform and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1668] In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an

enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected

and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a set of intelligent

systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable a demand management application for a set of products of an enterprise and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1669] In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities.

In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network

entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable

prediction of demand for set of offerings and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable prediction of demand for set of offerings and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1670] In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities. In embodiments, provided herein is an information technology system having a set of adaptive

intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of

value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on

information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information collected and managed in a value chain network management platform to enable management of a set of healthcare supply chain activities and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1671] In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of

attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In

embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin of a customer of an enterprise for representing a set of attributes of the customer that are relevant to engagement by the customer with a set of offerings of the enterprise and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1672] In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of

entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology

system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain

components in a supply chain for a set of products of an enterprise and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of digital twins that represent attributes of a set of supply chain components in a supply chain for a set of products of an enterprise and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1673] In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having set of intelligent systems

for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology

system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of

adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems operating on information handled within a value chain network management platform, wherein the set of adaptive intelligent systems use a set of digital twins that represent attributes of a set of entities in a supply chain for a set of products of an enterprise and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1674] In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a set of adaptive intelligent

systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain

network management platform. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for configuring a set of policies within a value chain network management platform and for automatically managing implementation the policies to govern operation of a set of value chain network entities and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1675] In embodiments, provided herein is an information technology system having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise. In embodiments, provided herein is an information technology system having a

digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a digital twin

representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information

technology system having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a digital twin representing a set of supply chain entities and activities and having a set of adaptive intelligent systems for integration supply chain and demand management activities for a set of products for an enterprise and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1676] In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform and having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of

an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information

handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically configuring a set of parameters for a set of consumer goods based on information collected about a set of value chain network entities and activities by a value chain network management platform and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1677] In embodiments, provided herein is an information technology system having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform. In embodiments, provided herein is an information technology system having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform and having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate

testing of at least a subset of the features. In embodiments, provided herein is an information technology system having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having set of intelligent systems for populating a digital twin of a warehouse based on

information collected about a set of value chain network entities and activities in a value chain network management platform and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having set of intelligent systems for populating a digital twin of a warehouse based on information collected about a set of value chain network entities and activities in a value chain network management platform and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1678] In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system and having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system and having a pre-configured kit for enabling a network-connected set of value chain

network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive

intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of adaptive intelligent systems that operate on information collected in a value chain network management platform about delivery activities to populate attributes of a digital twin of a delivery system and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1679] In embodiments, provided herein is an information technology system having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features and having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a system

for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features and having a

system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a product, wherein the digital twin is configured to represent a set of features of the product that facilitate testing of at least a subset of the features and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1680] In embodiments, provided herein is an information technology system having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise. In embodiments, provided herein is an information technology system having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise and having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a pre-configured kit for enabling a network-connected set of value chain network

entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an

enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a pre-configured kit for enabling a network-connected set of value chain network entity monitoring facilities in the supply chain for a set of products of an enterprise, wherein the monitoring facilities are configured to establish connection to a cloud-based value chain network management platform having a set of microservices for managing the value chain network entities for the enterprise and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1681] In embodiments, provided herein is an information technology system having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved and having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved and having a set of intelligent systems for automatically populating

attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for generating a digital twin of a set of workers, wherein the digital twin is configured to represent a set of attributes of the set of workers relevant to a value chain workflow of an enterprise in which the set of workers is involved and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1682] In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform and having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information

collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1683] In embodiments, provided herein is an information technology system having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for managing a set of shipping infrastructure entities in a value chain network based on information collected in a value chain network management platform and having a system for automatically

managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1684] In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform and having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating attributes of a digital twin of a set of shipping fleet entities based on data collected by a value chain network management platform and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1685] In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform and having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems for automatically populating attributes of a digital twin of a set of container ship entities based on data collected by a value chain network management platform and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1686] In embodiments, provided herein is an information technology system having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform and having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information

technology system having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for managing connectivity between a value chain management platform and a set of entities in a value chain network based on information handled in a value chain network management platform and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1687] In embodiments, provided herein is an information technology system having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities. In embodiments, provided herein is an information technology system having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities and having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for discovering in a network of entities a set of value chain network entities based on a defined set of attributes of the entities and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1688] In embodiments, provided herein is an information technology system having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network. In embodiments, provided herein is an information technology system having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain

network and having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a set of intelligent systems in a value chain network management platform for configuring and managing interactions among entities in a value chain network and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1689] In embodiments, provided herein is an information technology system having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform. In embodiments, provided herein is an information technology system having a system for selecting and configuring a data architecture among a set of available data architectures to enable a set of capabilities in a value chain network management platform and having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

[1690] In embodiments, provided herein is an information technology system having a system for automatically managing a set of autonomous vehicles to undertake a set of tasks in support of a set of value chain network activities managed by a value chain network management platform.

SOFTWARE AND NETWORKING CAPABILITIES

[1691] While only a few embodiments of the present disclosure have been shown and described, it will be obvious to those skilled in the art that many changes and modifications may be made thereunto without departing from the spirit and scope of the present disclosure as described in the following claims. All patent applications and patents, both foreign and domestic, and all other publications referenced herein are incorporated herein in their entireties to the full extent permitted by law.

[1692] The methods and systems described herein may be deployed in part or in whole through a machine that executes computer software, program codes, and/or instructions on a processor. The present disclosure may be implemented as a method on the machine, as a system or apparatus as part of or in relation to the machine, or as a computer program product embodied in a computer readable medium executing on one or more of the machines. In embodiments, the processor may be part of a server, cloud server, client, network infrastructure, mobile computing platform, stationary computing platform, or other computing platforms. A processor may be any kind of computational or processing device capable of executing program instructions, codes, binary instructions and the like, including a central processing unit (CPU), a general processing unit (GPU), a logic board, a chip (e.g., a graphics chip, a video processing chip, a data compression

chip, or the like), a chipset, a controller, a system-on-chip (e.g., an RF system on chip, an AI system on chip, a video processing system on chip, an organ-on-chip, a quantum algorithm system on chip, or others), an integrated circuit, an application specific integrated circuit (ASIC), a field programmable gate array (FPGA), a complex programmable logic device (CPLD), an approximate computing processor, a quantum computing processor, a parallel computing processor, a neural network processor, or other type of processor. The processor may be or may include a signal processor, digital processor, data processor, embedded processor, microprocessor or any variant such as a co-processor (math co-processor, graphic co-processor, communication co-processor, video co-processor, AI co-processor, and the like) and the like that may directly or indirectly facilitate execution of program code or program instructions stored thereon. In addition, the processor may enable execution of multiple programs, threads, and codes. The threads may be executed simultaneously to enhance the performance of the processor and to facilitate simultaneous operations of the application. By way of implementation, methods, program codes, program instructions and the like described herein may be implemented in one or more threads. The thread may spawn other threads that may have assigned priorities associated with them; the processor may execute these threads based on priority or any other order based on instructions provided in the program code. The processor, or any machine utilizing one, may include non-transitory memory that stores methods, codes, instructions and programs as described herein and elsewhere. The processor may access a non-transitory storage medium through an interface that may store methods, codes, and instructions as described herein and elsewhere. The storage medium associated with the processor for storing methods, programs, codes, program instructions or other type of instructions capable of being executed by the computing or processing device may include but may not be limited to one or more of a CD-ROM, DVD, memory, hard disk, flash drive, RAM, ROM, cache, network-attached storage, server-based storage, and the like.

[1693] A processor may include one or more cores that may enhance speed and performance of a multiprocessor. In embodiments, the process may be a dual core processor, quad core processors, other chip-level multiprocessor and the like that combine two or more independent cores (sometimes called a die).

[1694] The methods and systems described herein may be deployed in part or in whole through a machine that executes computer software on a server, client, firewall, gateway, hub, router, switch, infrastructure-as-a-service, platform-as-a-service, or other such computer and/or networking hardware or system. The software may be associated with a server that may include a file server, print server, domain server, internet server, intranet server, cloud server, infrastructure-as-a-service server, platform-as-a-service server, web server, and other variants such as secondary server, host server, distributed server, failover server, backup server, server farm, and the like. The server may

include one or more of memories, processors, computer readable media, storage media, ports (physical and virtual), communication devices, and interfaces capable of accessing other servers, clients, machines, and devices through a wired or a wireless medium, and the like. The methods, programs, or codes as described herein and elsewhere may be executed by the server. In addition, other devices required for execution of methods as described in this application may be considered as a part of the infrastructure associated with the server.

[1695] The server may provide an interface to other devices including, without limitation, clients, other servers, printers, database servers, print servers, file servers, communication servers, distributed servers, social networks, and the like. Additionally, this coupling and/or connection may facilitate remote execution of programs across the network. The networking of some or all of these devices may facilitate parallel processing of a program or method at one or more locations without deviating from the scope of the disclosure. In addition, any of the devices attached to the server through an interface may include at least one storage medium capable of storing methods, programs, code and/or instructions. A central repository may provide program instructions to be executed on different devices. In this implementation, the remote repository may act as a storage medium for program code, instructions, and programs.

[1696] The software program may be associated with a client that may include a file client, print client, domain client, internet client, intranet client and other variants such as secondary client, host client, distributed client and the like. The client may include one or more of memories, processors, computer readable media, storage media, ports (physical and virtual), communication devices, and interfaces capable of accessing other clients, servers, machines, and devices through a wired or a wireless medium, and the like. The methods, programs, or codes as described herein and elsewhere may be executed by the client. In addition, other devices required for the execution of methods as described in this application may be considered as a part of the infrastructure associated with the client.

[1697] The client may provide an interface to other devices including, without limitation, servers, other clients, printers, database servers, print servers, file servers, communication servers, distributed servers and the like. Additionally, this coupling and/or connection may facilitate remote execution of programs across the network. The networking of some or all of these devices may facilitate parallel processing of a program or method at one or more locations without deviating from the scope of the disclosure. In addition, any of the devices attached to the client through an interface may include at least one storage medium capable of storing methods, programs, applications, code and/or instructions. A central repository may provide program instructions to be executed on different devices. In this implementation, the remote repository may act as a storage medium for program code, instructions, and programs.

[1698] The methods and systems described herein may be deployed in part or in whole through network infrastructures. The network infrastructure may include elements such as computing devices, servers, routers, hubs, firewalls, clients, personal computers, communication devices, routing devices and other active and passive devices, modules and/or components as known in the art. The computing and/or non-computing device(s) associated with the network infrastructure may include, apart from other components, a storage medium such as flash memory, buffer, stack, RAM, ROM and the like. The processes, methods, program codes, instructions described herein and elsewhere may be executed by one or more of the network infrastructural elements. The methods and systems described herein may be adapted for use with any kind of private, community, or hybrid cloud computing network or cloud computing environment, including those which involve features of software as a service (SaaS), platform as a service (PaaS), and/or infrastructure as a service (IaaS).

[1699] The methods, program codes, and instructions described herein and elsewhere may be implemented on a cellular network with multiple cells. The cellular network may either be frequency division multiple access (FDMA) network or code division multiple access (CDMA) network. The cellular network may include mobile devices, cell sites, base stations, repeaters, antennas, towers, and the like. The cell network may be a GSM, GPRS, 3G, 4G, 5G, LTE, EVDO, mesh, or other network types.

[1700] The methods, program codes, and instructions described herein and elsewhere may be implemented on or through mobile devices. The mobile devices may include navigation devices, cell phones, mobile phones, mobile personal digital assistants, laptops, palmtops, netbooks, pagers, electronic book readers, music players and the like. These devices may include, apart from other components, a storage medium such as flash memory, buffer, RAM, ROM and one or more computing devices. The computing devices associated with mobile devices may be enabled to execute program codes, methods, and instructions stored thereon. Alternatively, the mobile devices may be configured to execute instructions in collaboration with other devices. The mobile devices may communicate with base stations interfaced with servers and configured to execute program codes. The mobile devices may communicate on a peer-to-peer network, mesh network, or other communications network. The program code may be stored on the storage medium associated with the server and executed by a computing device embedded within the server. The base station may include a computing device and a storage medium. The storage device may store program codes and instructions executed by the computing devices associated with the base station.

[1701] The computer software, program codes, and/or instructions may be stored and/or accessed on machine readable media that may include: computer components, devices, and recording media that retain digital data used for computing for some interval of time; semiconductor storage known

as random access memory (RAM); mass storage typically for more permanent storage, such as optical discs, forms of magnetic storage like hard disks, tapes, drums, cards and other types; processor registers, cache memory, volatile memory, non-volatile memory; optical storage such as CD, DVD; removable media such as flash memory (e.g., USB sticks or keys), floppy disks, magnetic tape, paper tape, punch cards, standalone RAM disks, Zip drives, removable mass storage, off-line, and the like; other computer memory such as dynamic memory, static memory, read/write storage, mutable storage, read only, random access, sequential access, location addressable, file addressable, content addressable, network attached storage, storage area network, bar codes, magnetic ink, network-attached storage, network storage, NVME-accessible storage, PCIE connected storage, distributed storage, and the like.

[1702] The methods and systems described herein may transform physical and/or intangible items from one state to another. The methods and systems described herein may also transform data representing physical and/or intangible items from one state to another.

[1703] The elements described and depicted herein, including in flow charts and block diagrams throughout the figures, imply logical boundaries between the elements. However, according to software or hardware engineering practices, the depicted elements and the functions thereof may be implemented on machines through computer executable code using a processor capable of executing program instructions stored thereon as a monolithic software structure, as standalone software modules, or as modules that employ external routines, code, services, and so forth, or any combination of these, and all such implementations may be within the scope of the present disclosure. Examples of such machines may include, but may not be limited to, personal digital assistants, laptops, personal computers, mobile phones, other handheld computing devices, medical equipment, wired or wireless communication devices, transducers, chips, calculators, satellites, tablet PCs, electronic books, gadgets, electronic devices, devices, artificial intelligence, computing devices, networking equipment, servers, routers and the like. Furthermore, the elements depicted in the flow chart and block diagrams or any other logical component may be implemented on a machine capable of executing program instructions. Thus, while the foregoing drawings and descriptions set forth functional aspects of the disclosed systems, no particular arrangement of software for implementing these functional aspects should be inferred from these descriptions unless explicitly stated or otherwise clear from the context. Similarly, it will be appreciated that the various steps identified and described above may be varied, and that the order of steps may be adapted to particular applications of the techniques disclosed herein. All such variations and modifications are intended to fall within the scope of this disclosure. As such, the depiction and/or description of an order for various steps should not be understood to require a particular order of

execution for those steps, unless required by a particular application, or explicitly stated or otherwise clear from the context.

[1704] The methods and/or processes described above, and steps associated therewith, may be realized in hardware, software or any combination of hardware and software suitable for a particular application. The hardware may include a general-purpose computer and/or dedicated computing device or specific computing device or particular aspect or component of a specific computing device. The processes may be realized in one or more microprocessors, microcontrollers, embedded microcontrollers, programmable digital signal processors or other programmable devices, along with internal and/or external memory. The processes may also, or instead, be embodied in an application specific integrated circuit, a programmable gate array, programmable array logic, or any other device or combination of devices that may be configured to process electronic signals. It will further be appreciated that one or more of the processes may be realized as a computer executable code capable of being executed on a machine-readable medium.

[1705] The computer executable code may be created using a structured programming language such as C, an object oriented programming language such as C++, or any other high-level or low-level programming language (including assembly languages, hardware description languages, and database programming languages and technologies) that may be stored, compiled or interpreted to run on one of the above devices, as well as heterogeneous combinations of processors, processor architectures, or combinations of different hardware and software, or any other machine capable of executing program instructions. Computer software may employ virtualization, virtual machines, containers, dock facilities, portainers, and other capabilities.

[1706] In embodiments, a value chain system that controls one or more processes to mitigate waste comprising: a machine learning system that trains machine-learned models that output waste mitigation decisions based on training data sets that each respectively defines one or more features of a respective process and an outcome relating to an amount of a type of waste generated by the respective process; an artificial intelligence system that receives a request for a waste mitigation decision and determines the waste mitigation decision based on one or more of the machine-learned models and the request; and a digital twin system that generates a digital twin of a process that incorporates the waste mitigation decision and executes a simulation based on the digital twin. In embodiments, the digital twin system outputs a graphical representation of the digital twin to a display, whereby a user views the simulation via the display.

[1707] In embodiments, the digital twin system outputs a graphical representation of the digital twin in a graphical user interface, whereby a user edits the process via the graphical user interface.

[1708] In embodiments, the digital twin system outputs a simulation outcome of the simulation to the machine learning system and the machine learning system reinforces the one or more machine learned models based on the simulation outcome. In embodiments, the request received by the artificial intelligence system includes one or more process features of the process. In embodiments, the process features include one or more of: a type of object being the physical objects, dimensions of the physical objects, masses of the physical objects, and shipping methods of the physical objects. In embodiments, a waste mitigation system adjusts the process in accordance with the waste mitigation decision and provides outcome data relating to the waste mitigation decision to the machine learning system, and the machine learning system reinforces the one or more models that provided the waste mitigation decision based on the outcome data. In embodiments, a value chain system that controls one or more processes to mitigate wastewater resulting from the one or more processes comprising: a machine learning system that trains machine-learned models that output wastewater mitigation decisions based on training data sets that each respectively defines one or more features of a respective process that generates wastewater and an outcome relating to an amount of wastewater generated by the respective process; an artificial intelligence system that receives a request for a wastewater mitigation decision and determines the wastewater mitigation decision based on one or more of the machine-learned models and the request; and a digital twin system that generates a digital twin of a process that incorporates the wastewater mitigation decision and executes a simulation based on the digital twin.

[1709] In embodiments, an information technology system having a management platform with a user interface that provides a set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods.

[1710] In embodiments, coordinated intelligence comprises artificial intelligence capabilities.

[1711] In embodiments, the artificial intelligence system facilitates coordinated intelligence for the set of demand management applications or the set of supply chain applications, or both for a category of goods by processing data that is available in any of a plurality of data sources including processes, bill of materials, weather, traffic, design specification, customer complaint logs, customer reviews, Enterprise Resource Planning (ERP) System, Customer Relationship Management (CRM) System, Customer Experience Management (CEM) System, Service Lifecycle Management (SLM) System, Product Lifecycle Management (PLM) System.

[1712] In embodiments the set of adaptive intelligence systems provide user access to artificial intelligence applications for coordinating intelligence for the sets of applications. In embodiments, the user interface presents a set of artificial intelligence systems responsive to the category of

goods. In embodiments, the user interface facilitates configuring the set of adaptive intelligence systems with at least one artificial intelligence system.

[1713] In embodiments, the at least one artificial intelligence system is a hybrid artificial intelligence system. In embodiments, the at least one artificial intelligence system comprises a hybrid neural network.

[1714] In embodiments, the set of adaptive intelligence systems provides a set of capabilities that facilitate development and deployment of intelligence for at least one function selected from a list of functions consisting of supply chain application automation, demand management application automation, machine learning, artificial intelligence, intelligent transactions, intelligent operations, remote control, analytics, monitoring, reporting, state management, event management, and process management. In embodiments, coordinated intelligence comprises artificial intelligence capabilities that operate on or responsive to data collected by or produced by other systems of an adaptive intelligence systems layer. In embodiments, the coordinated intelligence comprises artificial intelligence capabilities that provide coordinated intelligence for a specific operator and/or enterprise that participates in the supply chain for the category of goods. In embodiments, the coordinated intelligence includes a portion of a set of artificial intelligence systems that employs a neural network that processes at least one of demand management application outputs and supply chain application outputs to provide the coordinated intelligence.

[1715] In embodiments, the coordinated intelligence is configured through the user interface for at least two demand management applications selected from the list consisting of a demand planning application, a demand prediction application, a sales application, a future demand aggregation application, a marketing application, an advertising application, an e-commerce application, a marketing analytics application, a customer relationship management application, a search engine optimization application, a sales management application, an advertising network application, a behavioral tracking application, a marketing analytics application, a location-based product or service-targeting application, a collaborative filtering application, a recommendation engine for a product or service. In embodiments, coordinated intelligence is configured through the user interface for at least two supply chain applications selected from the list consisting of a goods timing management application, a goods quantity management application, a logistics management application, a shipping application, a delivery application, an order for goods management application, and an order for components management application.

[1716] In embodiments, an information technology system having a management platform with a user interface that provides a set of adaptive intelligence systems that provide coordinated intelligence comprising artificial intelligence capabilities for a set of demand management applications and a set of supply chain applications for a category of goods. In embodiments, the

artificial intelligence system facilitates coordinated intelligence for the set of demand management applications or the set of supply chain applications, or both for a category of goods by processing data that is available in any of a plurality of data sources including processes, bill of materials, weather, traffic, design specification, customer complaint logs, customer reviews, Enterprise Resource Planning (ERP) System, Customer Relationship Management (CRM) System, Customer Experience Management (CEM) System, Service Lifecycle Management (SLM) System, Product Lifecycle Management (PLM) System.

[1717] In embodiments, the set of adaptive intelligence systems provide user access to the artificial intelligence capabilities for coordinating intelligence for the sets of applications.

[1718] In embodiments, the user interface presents a set of artificial intelligence systems responsive to the category of goods. In embodiments, the user interface facilitates configuring the set of adaptive intelligence systems with at least one artificial intelligence system. In embodiments, the at least one artificial intelligence system is a hybrid artificial intelligence system. In embodiments, the at least one artificial intelligence system comprises a hybrid neural network. In embodiments, coordinated intelligence-based artificial intelligence capabilities operate on or responsive to data collected by or produced by other systems of an adaptive intelligence systems layer.

[1719] In embodiments, coordinated intelligence-based artificial intelligence capabilities provide coordinated intelligence for a specific operator and/or enterprise that participates in the supply chain for the category of goods.

[1720] In embodiments, the coordinated intelligence-based artificial intelligence capabilities employ a neural network that processes at least one of demand management application outputs and supply chain application outputs to provide the coordinated intelligence. In embodiments, coordinated intelligence-based artificial intelligence is configured through the user interface for at least two demand management applications selected from the list consisting of a demand planning application, a demand prediction application, a sales application, a future demand aggregation application, a marketing application, an advertising application, an e-commerce application, a marketing analytics application, a customer relationship management application, a search engine optimization application, a sales management application, an advertising network application, a behavioral tracking application, a marketing analytics application, a location-based product or service-targeting application, a collaborative filtering application, a recommendation engine for a product or service. In embodiments, coordinated intelligence-based artificial intelligence is configured through the user interface for at least two supply chain applications selected from the list consisting of a goods timing management application, a goods quantity management

application, a logistics management application, a shipping application, a delivery application, an order for goods management application, and an order for components management application.

[1721] In embodiments, an information technology system having a management platform with a set of artificial intelligence systems as part of a set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods so that the at least one supply chain application produces results that address at least one aspect of supply for at least one of the goods in the category of goods determined by at least one of the demand management applications.

[1722] In embodiments, the artificial intelligence systems provide coordinated intelligence for the set of demand management applications or the set of supply chain applications, or both for a category of goods by processing data that is available in any of a plurality of data sources including processes, bill of materials, weather, traffic, design specification, customer complaint logs, customer reviews, Enterprise Resource Planning (ERP) System, Customer Relationship Management (CRM) System, Customer Experience Management (CEM) System, Service Lifecycle Management (SLM) System, Product Lifecycle Management (PLM) System.

[1723] In embodiments, the set of adaptive intelligence systems provide user access to the set of artificial intelligence systems for use with the sets of applications. In embodiments, the user interface presents a set of artificial intelligence systems responsive to the category of goods. In embodiments, the user interface facilitates configuring the set of adaptive intelligence systems with at least one artificial intelligence system. In embodiments, the at least one artificial intelligence system is a hybrid artificial intelligence system. In embodiments, the at least one artificial intelligence system comprises a hybrid neural network. In embodiments, the set of artificial intelligence systems provides coordinated intelligence operates on or responsive to data collected by or produced by other systems of an adaptive intelligence systems layer. In embodiments, the set of artificial intelligence systems provides coordinated intelligence for a specific operator and/or enterprise that participates in the supply chain for the category of goods.

[1724] In embodiments, the set of artificial intelligence systems provides coordinated intelligence employs a neural network that processes at least one of demand management application outputs and supply chain application outputs to provide the coordinated intelligence. In embodiments, the set of artificial intelligence systems is configured through the user interface for at least two demand management applications selected from the list consisting of a demand planning application, a demand prediction application, a sales application, a future demand aggregation application, a marketing application, an advertising application, an e-commerce application, a marketing analytics application, a customer relationship management application, a search engine optimization application, a sales management application, an advertising network application, a

behavioral tracking application, a marketing analytics application, a location-based product or service-targeting application, a collaborative filtering application, a recommendation engine for a product or service. In embodiments, the set of artificial intelligence systems is configured through the user interface for at least two supply chain applications selected from the list consisting of a goods timing management application, a goods quantity management application, a logistics management application, a shipping application, a delivery application, an order for goods management application, and an order for components management application.

[1725] In embodiments, an information technology system having a management platform with a user interface that provides a hybrid set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications and a set of supply chain applications for a category of goods, wherein at least one type of artificial intelligence system is used with respect to a set of demand management applications and at least one other type of artificial intelligence system is used with respect to a set of supply chain applications.

[1726] In embodiments, the hybrid set of adaptive intelligence systems includes a plurality of distinct artificial intelligence systems. In embodiments, the hybrid set of adaptive intelligence systems includes a plurality of neural network-based systems. In embodiments, the hybrid set of adaptive intelligence systems provides coordinated intelligence for the set of demand management applications or the set of supply chain applications, or both for a category of goods by processing data that is available in any of a plurality of data sources including processes, bill of materials, weather, traffic, design specification, customer complaint logs, customer reviews, Enterprise Resource Planning (ERP) System, Customer Relationship Management (CRM) System, Customer Experience Management (CEM) System, Service Lifecycle Management (SLM) System, Product Lifecycle Management (PLM) System. In embodiments, the hybrid set of adaptive intelligence systems provides user access to the set of artificial intelligence systems for use with the sets of applications.

[1727] In embodiments, the user interface presents a hybrid set of adaptive intelligence systems responsive to the category of goods. In embodiments, the user interface facilitates configuring the hybrid set of adaptive intelligence systems with at least one artificial intelligence system.

[1728] In embodiments, the at least one artificial intelligence system is a hybrid artificial intelligence system. In embodiments, the at least one artificial intelligence system comprises a hybrid neural network. In embodiments, the hybrid set of adaptive intelligence systems that provides coordinated intelligence operates on or responsive to data collected by or produced by other systems of an adaptive intelligence systems layer. In embodiments, the hybrid set of adaptive intelligence systems provides coordinated intelligence for a specific operator and/or enterprise that participates in the supply chain for the category of goods. In embodiments, the hybrid set of

adaptive intelligence systems provides coordinated intelligence employs a neural network that processes at least one of demand management application outputs and supply chain application outputs to provide the coordinated intelligence. In embodiments, the hybrid set of adaptive intelligence systems is configured through the user interface for at least two demand management applications selected from the list consisting of a demand planning application, a demand prediction application, a sales application, a future demand aggregation application, a marketing application, an advertising application, an e-commerce application, a marketing analytics application, a customer relationship management application, a search engine optimization application, a sales management application, an advertising network application, a behavioral tracking application, a marketing analytics application, a location-based product or service-targeting application, a collaborative filtering application, a recommendation engine for a product or service. In embodiments, the hybrid set of adaptive intelligence systems is configured through the user interface for at least two supply chain applications selected from the list consisting of a goods timing management application, a goods quantity management application, a logistics management application, a shipping application, a delivery application, an order for goods management application, and an order for components management application. In embodiments, the at least one type of artificial intelligence system used with respect to a set of demand management applications is a machine learning-based system and wherein the at least one other type of artificial intelligence system is a neural network-based system.

[1729] In embodiments, the at least one type of artificial intelligence system used with respect to a set of demand management application is a first type of neural network-based system and wherein the at least one other type of artificial intelligence system is a second type of neural network-based system.

[1730] In embodiments, the at least one type of artificial intelligence system configured/selected/accessed through the user interface for use with respect to a set of demand management applications is a hybrid neural-network that applies a first type of neural network with respect to a first application of the set of demand management applications and a second type of neural network with respect to a second application of the set of demand management applications. In embodiments, the at least one other type of artificial intelligence system used with respect to a set of supply chain applications is a hybrid neural-network that applies a first type of neural network with respect to a first application of the set of supply chain applications and a second type of neural network with respect to a second application of the set of supply chain applications.

[1731] In embodiments, an information technology system having a management platform with a user interface that provides a set of adaptive intelligence systems that provide hybrid artificial intelligence capabilities for coordinated intelligence for a set of demand management applications

and a set of supply chain applications for a category of goods, wherein at least one type of artificial intelligence system is used with respect to a set of demand management applications and at least one other type of artificial intelligence system is used with respect to a set of supply chain applications.

[1732] In embodiments, the hybrid artificial intelligence capabilities include a plurality of distinct artificial intelligence systems.

[1733] In embodiments, the hybrid artificial intelligence capabilities include a plurality of neural network-based systems.

[1734] In embodiments, the hybrid artificial intelligence capabilities provide coordinated intelligence for the set of demand management applications or the set of supply chain applications, or both for a category of goods by processing data that is available in any of a plurality of data sources including processes, bill of materials, weather, traffic, design specification, customer complaint logs, customer reviews, Enterprise Resource Planning (ERP) System, Customer Relationship Management (CRM) System, Customer Experience Management (CEM) System, Service Lifecycle Management (SLM) System, Product Lifecycle Management (PLM) System.

[1735] In embodiments, the hybrid artificial intelligence capabilities provide user access to the set of artificial intelligence systems for use with the sets of applications. In embodiments, the user interface presents hybrid artificial intelligence capabilities responsive to the category of goods. In embodiments, the user interface facilitates configuring the hybrid artificial intelligence capabilities with at least one artificial intelligence system. In embodiments, the at least one artificial intelligence system is a hybrid artificial intelligence system. In embodiments, the at least one artificial intelligence system comprises a hybrid neural network. In embodiments, the hybrid artificial intelligence capabilities that provide coordinated intelligence operates on or responsive to data collected by or produced by other systems of an adaptive intelligence systems layer. In embodiments, the hybrid artificial intelligence capabilities provide coordinated intelligence for a specific operator and/or enterprise that participates in the supply chain for the category of goods.

[1736] In embodiments, the hybrid artificial intelligence capabilities provide coordinated intelligence employs a neural network that processes at least one of demand management application outputs and supply chain application outputs to provide the coordinated intelligence. In embodiments, the hybrid artificial intelligence capabilities are configured through the user interface for at least two demand management applications selected from the list consisting of a demand planning application, a demand prediction application, a sales application, a future demand aggregation application, a marketing application, an advertising application, an e-commerce application, a marketing analytics application, a customer relationship management application, a search engine optimization application, a sales management application, an advertising network

application, a behavioral tracking application, a marketing analytics application, a location-based product or service-targeting application, a collaborative filtering application, a recommendation engine for a product or service. In embodiments, the hybrid artificial intelligence capabilities are configured through the user interface for at least two supply chain applications selected from the list consisting of a goods timing management application, a goods quantity management application, a logistics management application, a shipping application, a delivery application, an order for goods management application, and an order for components management application.

In embodiments, the at least one type of artificial intelligence system used with respect to a set of demand management applications is a machine learning-based system and wherein the at least one other type of artificial intelligence system is a neural network-based system. In embodiments, the at least one type of artificial intelligence system used with respect to a set of demand management application is a first type of neural network-based system and wherein the at least one other type of artificial intelligence system is a second type of neural network-based system. In embodiments, the at least one type of artificial intelligence system configured/selected/accessed through the user interface for use with respect to a set of demand management applications is a hybrid neural-network that applies a first type of neural network with respect to a first application of the set of demand management applications and a second type of neural network with respect to a second application of the set of demand management applications. In embodiments, the at least one other type of artificial intelligence system used with respect to a set of supply chain applications is a hybrid neural-network that applies a first type of neural network with respect to a first application of the set of supply chain applications and a second type of neural network with respect to a second application of the set of supply chain applications.

[1737] In embodiments, an information technology system having a management platform with a user interface that provides a set of adaptive intelligence systems that provide a set of predictions for a coordinated set of demand management applications and supply chain applications for a category of goods.

[1738] In embodiments, the set of predictions includes a least one prediction of an impact on a supply chain application based on a current state of a coordinated demand management application. In embodiments, the set of predictions is a set of predictions of adjustments in supply required to meet demand. In embodiments, the set of predictions includes at least one prediction of change in demand that impacts supply. In embodiments, the set of predictions includes at least one prediction of change in supply that impacts at least one of the sets of demand management applications. In embodiments, the at least one of the sets of demand management applications is a promotion application for at least one good in the category of goods. In embodiments, the set of predictions includes a likelihood that a supply of a good in the category of goods will not meet demand.

[1739] In embodiments, an information technology system having a management platform with a user interface that provides a set of adaptive intelligence systems to provide a set of artificial intelligence capabilities that facilitate providing a set of predictions for a coordinated set of demand management applications and supply chain applications for a category of goods. In embodiments, the set of predictions includes a least one prediction of an impact on a supply chain application based on a current state of a coordinated demand management application.

[1740] In embodiments, the set of predictions is a set of predictions of adjustments in supply required to meet demand. In embodiments, the set of predictions includes at least one prediction of change in demand that impacts supply. In embodiments, the set of predictions includes at least one prediction of change in supply that impacts at least one of the sets of demand management applications. In embodiments, the at least one of the set of demand management applications is a promotion application for at least one good in the category of goods. In embodiments, the set of predictions includes a likelihood that a supply of a good in the category of goods will not meet demand.

[1741] In embodiments, an information technology system having a management platform with a set of adaptive intelligence systems that apply artificial intelligence to provide a set of predictions for a coordinated set of demand management applications and supply chain applications for a category of goods. In embodiments, the set of predictions includes a least one prediction of an impact on a supply chain application based on a current state of a coordinated demand management application. In embodiments, the set of predictions is a set of predictions of adjustments in supply required to meet demand. In embodiments, the set of predictions includes at least one prediction of change in demand that impacts supply. In embodiments, the set of predictions includes at least one prediction of change in supply that impacts at least one of the set of demand management applications.

[1742] In embodiments, the at least one of the set of demand management applications is a promotion application for at least one good in the category of goods. In embodiments, the set of predictions includes a likelihood that a supply of a good in the category of goods will not meet demand.

[1743] In embodiments, an information technology system having a management platform with a set of adaptive artificial intelligence systems that provide a set of predictions for a coordinated set of demand management applications and supply chain applications for a category of goods. In embodiments, the set of predictions includes a least one prediction of an impact on a supply chain application based on a current state of a coordinated demand management application. In embodiments, the set of predictions is a set of predictions of adjustments in supply required to meet demand. In embodiments, the set of predictions includes at least one prediction of change in

demand that impacts supply. In embodiments, the set of predictions includes at least one prediction of change in supply that impacts at least one of the set of demand management applications. In embodiments, the at least one of the set of demand management applications is a promotion application for at least one good in the category of goods. In embodiments, the set of predictions includes a likelihood that a supply of a good in the category of goods will not meet demand.

[1744] In embodiments, an information technology system having a management platform with a user interface that provides a set of adaptive intelligence systems that provide a set of predictions for a coordinated set of demand management applications and supply chain applications for a category of goods by applying artificial intelligence for coordinating the set of demand management applications and supply chain applications.

[1745] In embodiments, the set of predictions includes a least one prediction of an impact on a supply chain application based on a current state of a coordinated demand management application. In embodiments, the set of predictions is a set of predictions of adjustments in supply required to meet demand. In embodiments, the set of predictions includes at least one prediction of change in demand that impacts supply. In embodiments, the set of predictions includes at least one prediction of change in supply that impacts at least one of the set of demand management applications. In embodiments, the at least one of the set of demand management applications is a promotion application for at least one good in the category of goods. In embodiments, the set of predictions includes a likelihood that a supply of a good in the category of goods will not meet demand.

[1746] In embodiments, an information technology system having a management platform with a user interface that provides a set of adaptive intelligence systems that provide a set of predictions of outcomes from operating a supply chain with a coordinated set of demand management applications and supply chain applications for a category of goods. In embodiments, the set of predictions includes a least one prediction of an impact on a supply chain application based on a current state of a coordinated demand management application.

[1747] In embodiments, the set of predictions is a set of predictions of adjustments in supply required to meet demand. In embodiments, the set of predictions includes at least one prediction of change in demand that impacts supply. In embodiments, the set of predictions includes at least one prediction of change in supply that impacts at least one of the set of demand management applications. In embodiments, the at least one of the set of demand management applications is a promotion application for at least one good in the category of goods. In embodiments, the set of predictions includes a likelihood that a supply of a good in the category of goods will not meet demand. In embodiments, an information technology system having a management platform with a user interface that provides a set of adaptive intelligence systems that provide a set of classifications for a coordinated set of demand management applications and supply chain

applications for a category of goods. In embodiments, the set of classifications comprises at least one neural network adapted to classify information associated with the category of goods. In embodiments, the at least one neural network is a multilayered feed forward neural network. In embodiments, the user interface facilitates access to artificial intelligence classification capabilities adapted for use with the coordinated set of demand management applications and supply chain applications.

[1748] In embodiments, the set of classifications comprises a set of classifications of artificial intelligence capabilities to facilitate user application of the artificial intelligence capabilities for the category of goods. In embodiments, an information technology system having a management platform with a set of adaptive intelligence systems that provide a set of artificial intelligence capabilities for performing classifications for a coordinated set of demand management applications and supply chain applications for a category of goods.

[1749] In embodiments, the set of artificial intelligence capabilities comprises at least one neural network adapted to classify information associated with the category of goods. In embodiments the at least one neural network is a multilayered feed forward neural network. In embodiments, the user interface facilitates access to artificial intelligence classification capabilities in the set of artificial intelligence capabilities adapted for use with the coordinated set of demand management applications and supply chain applications. In embodiments, performing classifications comprises classifying available adaptive intelligence systems as one of suitable for use with a demand management application and suitable for use with a supply chain application. In embodiments, performing classifications comprises classifying discovered value chain entities as one of demand centric and supply centric.

[1750] In embodiments, an information technology system having a management platform with a user interface that provides a set of adaptive intelligence systems that provide a set of classifications for a coordinated set of demand management applications and supply chain applications for a category of goods by applying artificial intelligence capabilities for coordinating the set of demand management applications and supply chain applications.

[1751] In embodiments, applying artificial intelligence capabilities comprises applying at least one neural network adapted to classify information associated with the category of goods.

[1752] In embodiments, the at least one neural network is a multilayered feed forward neural network.

[1753] In embodiments, the user interface facilitates determining the coordinated set of demand management applications and supply chain applications to which the artificial intelligence capabilities apply. In embodiments, applying artificial intelligence capabilities comprises

classifying available adaptive intelligence systems as one of suitable for use with a demand management application and suitable for use with a supply chain application.

[1754] In embodiments, applying artificial intelligence capabilities comprises classifying discovered value chain entities as one of demand centric and supply centric.

[1755] An information technology system having a management platform with a user interface that provides a set of adaptive intelligence systems that provide a set of classifications of outcomes from operating a supply chain with a coordinated set of demand management applications and supply chain applications for a category of goods.

[1756] In embodiments, an information technology system having a management platform with a user interface that provides a set of adaptive intelligence systems that provide a set of automated control signals for a coordinated set of demand management applications and supply chain applications for a category of goods. In embodiments, the set of automated control signals comprises at least one control signal for execution of a supply chain application in the coordinated set of demand management applications and supply chain applications.

[1757] In embodiments, the set of automated control signals comprises at least one control signal for execution of a demand management application in the coordinated set of demand management applications and supply chain applications. In embodiments, the automated control signals control timing of demand management applications based on goods supply status. In embodiments, in the adaptive intelligence systems apply machine learning to outcomes of supply to automatically adapt a set of demand management application control signals.

[1758] In embodiments, the adaptive intelligence systems apply machine learning to outcomes of demand management to automatically adapt a set of supply chain application control signals. In embodiments, the set of adaptive intelligence systems determine aspects of a value chain that impact automated control of the coordinated set of demand management applications and supply chain applications for a category of goods.

[1759] In embodiments, the set of adaptive intelligence systems determines at least one range of application control values within which control can be automated. In embodiments, the at least one range is a supply rate. In embodiments, the at least one range is a supply timing rate. In embodiments, the at least one range is a mix of goods in the category of goods.

[1760] In embodiments, an information technology system having a management platform with a set of adaptive intelligence systems that apply artificial intelligence to provide a set of automated control signals for a coordinated set of demand management applications and supply chain applications for a category of goods.

[1761] In embodiments, the set of automated control signals comprises at least one control signal for execution of a supply chain application in the coordinated set of demand management

applications and supply chain applications .In embodiments, the set of automated control signals comprises at least one control signal for execution of a demand management application in the coordinated set of demand management applications and supply chain applications. In embodiments, the automated control signals control timing of demand management applications based on goods supply status. In embodiments, the adaptive intelligence systems apply machine learning to outcomes of supply to automatically adapt a set of demand management application control signals.

[1762] In embodiments, the adaptive intelligence systems apply machine learning to outcomes of demand management to automatically adapt a set of supply chain application control signals. In embodiments, the set of adaptive intelligence systems determine aspects of a value chain that impact automated control of the coordinated set of demand management applications and supply chain applications for a category of goods. In embodiments, the set of adaptive intelligence systems determines at least one range of application control values within which control can be automated. In embodiments, the at least one range is a supply rate. In embodiments, the at least one range is a supply timing rate. In embodiments, the at least one range is a mix of goods in the category of goods.

[1763] In embodiments, an information technology system having a management platform with a user interface that provides a set of adaptive intelligence systems that provide a set of automated control signals for a coordinated set of demand management applications and supply chain applications for a category of goods by applying artificial intelligence for coordinating the set of demand management applications and supply chain applications.

[1764] In embodiments, the set of automated control signals comprises at least one control signal for execution of a supply chain application in the coordinated set of demand management applications and supply chain applications. In embodiments, the set of automated control signals comprises at least one control signal for execution of a demand management application in the coordinated set of demand management applications and supply chain applications. In embodiments, the automated control signals control timing of demand management applications based on goods supply status. In embodiments, the adaptive intelligence systems apply machine learning to outcomes of supply to automatically adapt a set of demand management application control signals.

[1765] In embodiments, the adaptive intelligence systems apply machine learning to outcomes of demand management to automatically adapt a set of supply chain application control signals. In embodiments, the set of adaptive intelligence systems determine aspects of a value chain that impact automated control of the coordinated set of demand management applications and supply chain applications for a category of goods.

[1766] In embodiments, the set of adaptive intelligence systems determines at least one range of application control values within which control can be automated. In embodiments, the at least one range is a supply rate. In embodiments, the at least one range is a supply timing rate. In embodiments, the at least one range is a mix of goods in the category of goods.

[1767] In embodiments, an information technology system having a management platform with a user interface that provides a set of adaptive intelligence systems that provide a set of automated control signals that are responsive to outcomes from operating a supply chain with a coordinated set of demand management applications and supply chain applications for a category of goods. In embodiments, the set of automated control signals comprises at least one control signal for execution of a supply chain application in the coordinated set of demand management applications and supply chain applications. In embodiments, the set of automated control signals comprises at least one control signal for execution of a demand management application in the coordinated set of demand management applications and supply chain applications. In embodiments, the automated control signals control timing of demand management applications based on goods supply status. In embodiments, the adaptive intelligence systems apply machine learning to outcomes of supply to automatically adapt a set of demand management application control signals. In embodiments, the adaptive intelligence systems apply machine learning to outcomes of demand management to automatically adapt a set of supply chain application control signals.

[1768] In embodiments, the set of adaptive intelligence systems determine aspects of a value chain that impact automated control of the coordinated set of demand management applications and supply chain applications for a category of goods. In embodiments, the set of adaptive intelligence systems determines at least one range of application control values within which control can be automated. In embodiments, the at least one range is a supply rate.

[1769] In embodiments, the at least one range is a supply timing rate. In embodiments, the at least one range is a mix of goods in the category of goods.

[1770] In embodiments, an information technology system having an artificial intelligence/machine learning system for learning on a training set of outcomes, parameters, and data collected from a set of information routing activities in a set of value chain networks and for providing an information routing recommendation based on current status information for a selected value chain network. In embodiments, the artificial intelligence/machine learning system trains on transaction types within the value chain network. In embodiments, the information routing recommendation is based on a transaction type within the value chain network for which information is being routed. In embodiments the information routing recommendation is based on a type of information being routed within the value chain network. In embodiments, the information routing recommendation is based on network types within the value chain network. In

embodiments, the information routing recommendation is based on compatibility of information being routed with a network routing protocol for at least one candidate route within the value chain network. In embodiments, the information routing recommendation is based on detected network conditions. In embodiments, the information routing recommendation is based on an existence of edge intelligence. In embodiments, the information routing recommendation is based on an availability of networking resources. In embodiments, the information routing recommendation is based on network storage resources.

[1771] In embodiments, the information routing recommendation is based on detection of network resources/entities.

[1772] In embodiments, the information routing recommendation is based on goals of routing. In embodiments, the goals of routing comprise a measure of quality of service (QoS). In embodiments, the goals of routing comprise a measure reliability. In embodiments, the measure of reliability is a transmission failure rate. In embodiments, the goals of routing comprise a measure of latency associated with a candidate route. In embodiments, the goals of routing are based on information availability within the selected value chain network. In embodiments, the goals of routing are based on information persistence within the selected value chain network. In embodiments, the artificial intelligence/machine learning system develops an understanding of parameters of routing that impact information value. In embodiments, the artificial intelligence/machine learning system facilitates recommending routes that maintain information value. In embodiments, the artificial intelligence/machine learning system is configured to develop an understanding of timing of information supply versus information demand.

[1773] In embodiments, the artificial intelligence/machine learning system develops an understanding of needs for coordination of information delivery. In embodiments, coordination of information delivery includes ensuring delivery of an item of information to a first node before delivering the item of information to a second node in the selected value chain network. In embodiments, the artificial intelligence/machine learning system is selected from a list of systems consisting of decision trees, k-nearest neighbor, linear regression, k-means clustering, deep learning neural network, random forest, logistic regression, naïve Bayes, learning vector quantization, support vector machines, linear discriminant analysis, boosting, principal component analysis, hybrid of k-means and linear regression. In embodiments, the routing recommendations are based on a topology of the selected value chain network. In embodiments, the routing recommendations are adapted based on availability of edge intelligence in the selected value chain network. In embodiments, the routing recommendations are adapted based on location and availability of network storage resources in the selected value chain network.

[1774] In embodiments, an information technology system having an artificial intelligence/machine learning system for learning on a training set of outcomes, parameters, and data collected from a set of data sources relating to a set of value chain entities and activities to recognize a problem state in a portion of a value chain network using computing resources that are local to a set of value chain network entities that are experiencing the problem. In embodiments, to recognize a problem state is based on variances in outcomes over time from a portion of the value chain network. In embodiments, variances in outcomes over time indicate a problem state. In embodiments, the artificial intelligence/machine learning system determines an acceptable range of outcome variance. In embodiments, the acceptable range is a standard deviation of the outcomes.

[1775] In embodiments, the artificial intelligence/machine learning system determines a problem state threshold for at least one measure of the value chain network. In embodiments, to recognize a problem state comprises detecting at least one measure of the value chain that is greater than the problem state threshold.

[1776] In embodiments, to recognize a problem state is based on variances in start/end times of scheduled value chain network entity activities. In embodiments, to recognize a problem state is based on variances in at least one of production time, production quality, production rate, production start time, production resource availability or trends thereof .In embodiments, to recognize a problem state is based on variances in a measure of shipping supply. In embodiments, a problem state is a duration of time for transfer from one mode of transport to another greater than a problem state threshold variance in quality testing. In embodiments, the machine learning/artificial intelligence systems predict a correlated pain point further along the supply chain due to a detected pain point.

[1777] In embodiments, the predicted correlated pain point is a least one of a risk and/or need for overtime.

[1778] In embodiments, the predicted correlated pain point is a least one of risk and/or need for expedited shipping.

[1779] In embodiments, the predicted correlated pain point is a least one of risk and/or need for discounted goods prices.

[1780] In embodiments, the machine learning/artificial intelligence systems determines a problem state based on a detected stress level of humans along the supply chain. In embodiments, the detected stress level of humans is based on data received from at least one physiological wearable detector. In embodiments, the machine learning / artificial intelligence system uses natural language processing to identify phrases in digital communications within and/or among value chain entities that indicate candidate problem states. In embodiments, the machine learning /

artificial intelligence system processes outcomes, parameters, and data collected from a set of data sources relating to a set of value chain entities and activities to detect at least one pain point selected from the list of pain points consisting of late shipment, damaged container, damaged goods, wrong goods, customs delay, unpaid duties, weather event, damaged infrastructure, blocked waterway, incompatible infrastructure, congested port, congested handling infrastructure, congested roadway, congested distribution center, rejected goods, returned goods, waste material, wasted energy, wasted labor force, untrained workforce, poor customer service, empty transport vehicle on return route, excessive fuel prices, excessive tariffs.

[1781] In embodiments, an information technology system having a set of artificial intelligence systems operating on information from a monitoring set of network-connected value chain network entities to enable automated coordination of a set of value chain network activities involving a set of products of an enterprise.

[1782] In embodiments, the monitoring set of network connected value chain entities is generated by a value chain monitoring system. In embodiments, activity data for the monitoring set is captured by a collection and management systems. In embodiments, the automate coordination is performed at least in part through an application programming connectivity facility. In embodiments, the application programming connectivity facility automates access to the monitored activity information. In embodiments, compromising a plurality of interconnected entities that each perform several activities for completing the value chain. In embodiments, the artificial intelligence-type systems comprise at least one of a machine learning system, an expert system, a self-organizing system. In embodiments, the automated coordination comprises configuring activity workflows with an artificial intelligence system. In embodiments, the automated coordination involves automating value chain network activities that produce the product. In embodiments, the automated coordination involves configuring resources required for a workflow of an activity. In embodiments, the set of artificial intelligence systems further determine relationships among value change network entities and activities. In embodiments, the automated coordination is based on inputs used by the activities. In embodiments, the automated coordination is based on results produced by the activities. In embodiments, the set of artificial intelligence systems comprises at least one hybrid artificial intelligence system. In embodiments, the automated coordination comprises generation of automated control signals. In embodiments, the automated coordination comprises semi-sentient problem recognition. In embodiments, the semi-sentient problem recognition is based on structured content. In embodiments, the semi-sentient problem recognition is based on unstructured content. In embodiments, the semi-sentient problem recognition is based on measures of human emotion.

[1783] In embodiments, an information technology system leveraging digital twins in a value chain having a plurality of value chain entities, the information technology system comprising: a plurality of sensors positioned in, on, and/or near a value chain entity of the value chain entities and configured to collect sensor data related to the value chain entity, the sensor data being substantially real-time sensor data; and an adaptive intelligence system connected to the plurality of sensors and configured to receive the sensor data from the plurality of sensors, the adaptive intelligence system including: an artificial intelligence system configured to input the sensor data into a machine learning model, the sensor data being used as training data for the machine learning model, the machine learning model being configured to transform the sensor data into simulation data; and a digital twin system configured to create a digital replica of the value chain entity based on the simulation data, the digital replica of the value chain entity providing for substantially real-time representation of the value chain entity and providing for simulation of a possible future state of the value chain entity via the simulation data; wherein the machine learning model is configured to prioritize collection and receipt of sensor data related to simulations of the digital replica of the value chain entity .In embodiments, the machine learning model is configured to learn which types of sensor data are relevant to dynamics of the value chain entity and simulation thereof.

[1784] In embodiments, the machine learning model is configured to make suggestions to a user of the information technology system regarding potential changes to the plurality of sensors that would improve simulation of the value chain entity via the digital twin system. In embodiments, the machine learning model is configured to prioritize collection and transmission of sensor data that are relevant to dynamics of the value chain entity and simulation thereof.

[1785] In embodiments, an information technology system leveraging digital twins in a value chain having a plurality of value chain entities, the information technology system comprising: a plurality of sensors positioned in, on, and/or near a value chain entity of the value chain entities and configured to collect sensor data related to the value chain entity, the sensor data being substantially real-time sensor data; and an adaptive intelligence system connected to the plurality of sensors and configured to receive the sensor data from the plurality of sensors, the adaptive intelligence system including: an artificial intelligence system configured to input the sensor data into a machine learning model, the sensor data being used as training data for the machine learning model, the machine learning model being configured to transform the sensor data into simulation data; and a digital twin system configured to create a digital replica of the value chain entity based on the simulation data, the digital replica of the value chain entity providing for substantially real-time representation of the value chain entity and providing for simulation of a possible future state of the value chain entity via the simulation data; wherein the machine learning model is configured to determine which types of the sensor data are to be included in the simulation data used to create

the digital replica of the value chain entity by the digital twin system, the machine learning model determining which types of the sensor data are to be included based on one or both of a modeling goal and a quality of the type of sensor data.

[1786] In embodiments, an information technology system leveraging digital twins in a value chain having a plurality of value chain entities, the information technology system comprising: a plurality of sensors positioned in, on, and/or near a value chain entity of the value chain entities and configured to collect sensor data related to the value chain entity, the sensor data being substantially real-time sensor data; and an adaptive intelligence system connected to the plurality of sensors and configured to receive the sensor data from the plurality of sensors, the adaptive intelligence system including: an artificial intelligence system configured to input the sensor data into a machine learning model, the sensor data being used as training data for the machine learning model, the machine learning model being configured to transform the sensor data into simulation data; and a digital twin system configured to create a digital replica of the value chain entity based on the simulation data, the digital replica of the value chain entity providing for substantially real-time representation of the value chain entity and providing for simulation of a possible future state of the value chain entity via the simulation data; wherein the artificial intelligence system includes a model interpretability system, the model interpretability system being configured to facilitate human understanding of training and outputs of the machine learning model.

[1787] In embodiments, the model interpretability system includes one or more of linear regression, logistic regression, a generalized linear model (GLM), a generalized additive model (GAM), a decision tree, a decision rule, RuleFit, Naive Bayes Classifier, a K-nearest neighbors algorithm, a partial dependence plot, individual conditional expectation (ICE), an accumulated local effects (ALE) plot, feature interaction, permutation feature importance, a global surrogate model, a local surrogate (LIME) model, scoped rules, i.e. anchors, Shapley values, Shapley additive explanations (SHAP), feature visualization, and network dissection.

[1788] In embodiments, an information technology system leveraging digital twins in a value chain having a plurality of value chain entities, the information technology system comprising: a plurality of sensors positioned in, on, and/or near a value chain entity of the value chain entities and configured to collect sensor data related to the value chain entity, the sensor data being substantially real-time sensor data; and an adaptive intelligence system connected to the plurality of sensors and configured to receive the sensor data from the plurality of sensors, the adaptive intelligence system including: an artificial intelligence system configured to input the sensor data into a machine learning model, the sensor data being used as training data for the machine learning model, the machine learning model being configured to transform the sensor data into simulation data; and a digital twin system configured to create a digital replica of the value chain entity based on the

simulation data, the digital replica of the value chain entity providing for substantially real-time representation of the value chain entity and providing for simulation of a possible future state of the value chain entity via the simulation data; wherein the artificial intelligence system includes a model interpretability system, the model interpretability system being configured to facilitate human understanding of training and outputs of the machine learning model; and wherein the model dataset visualization system provides human-readable analysis related to distribution of values across features of the simulation data.

[1789] In embodiments, an information technology system leveraging digital twins in a value chain having a plurality of value chain entities, the information technology system comprising: a plurality of sensors positioned in, on, and/or near a value chain entity of the value chain entities and configured to collect sensor data related to the value chain entity, the sensor data being substantially real-time sensor data; and an adaptive intelligence system connected to the plurality of sensors and configured to receive the sensor data from the plurality of sensors, the adaptive intelligence system including: an artificial intelligence system configured to input the sensor data into a machine learning model, the sensor data being used as training data for the machine learning model, the machine learning model being configured to transform the sensor data into simulation data; and a digital twin system configured to create a digital replica of the value chain entity based on the simulation data, the digital replica of the value chain entity providing for substantially real-time representation of the value chain entity and providing for simulation of a possible future state of the value chain entity via the simulation data; wherein the artificial intelligence system includes an embedded model interpretability system, the embedded model interpretability system being configured to facilitate human understanding of training and outputs of the machine learning model, and the embedded model interpretability system including a model dataset visualization system. In embodiments, the embedded model interpretability system implements a Bayesian case model that facilitates human understanding of the cognition of the machine learning model. In embodiments, the embedded model interpretability system implements a glass box model that facilitates human understanding of the cognition of the machine learning model. In embodiments, the glass box model is a Gaussian process model.

[1790] In embodiments, an information technology system leveraging digital twins in a value chain having a plurality of value chain entities, the information technology system comprising: a plurality of sensors positioned in, on, and/or near a value chain entity of the value chain entities and configured to collect sensor data related to the value chain entity, the sensor data being substantially real-time sensor data; and an adaptive intelligence system connected to the plurality of sensors and configured to receive the sensor data from the plurality of sensors, the adaptive intelligence system including: an artificial intelligence system configured to input the sensor data into a machine

learning model, the sensor data being used as training data for the machine learning model, the machine learning model being configured to transform the sensor data into simulation data; and a digital twin system configured to create a digital replica of the value chain entity based on the simulation data, the digital replica of the value chain entity providing for substantially real-time representation of the value chain entity and providing for simulation of a possible future state of the value chain entity via the simulation data;

[1791] wherein the artificial intelligence system includes a model interpretability system, the model interpretability system being configured to facilitate human understanding of training and outputs of the machine learning model; and wherein the model interpretability system is configured to implement Testing with Concept Activation Vectors (TCAV) functionality, whereby the model interpretability facilitates learning of human-interpretable concepts by the machine learning model.

[1792] In embodiments, an information technology system leveraging digital twins in a value chain having a plurality of value chain entities, the information technology system comprising: a plurality of sensors positioned in, on, and/or near a value chain entity of the value chain entities and configured to collect sensor data related to the value chain entity, the sensor data being substantially real-time sensor data; and an adaptive intelligence system connected to the plurality of sensors and configured to receive the sensor data from the plurality of sensors, the adaptive intelligence system including: an artificial intelligence system configured to input the sensor data into a machine learning model, the sensor data being used as training data for the machine learning model, the machine learning model being configured to transform the sensor data into simulation data; and a digital twin system configured to create a digital replica of the value chain entity based on the simulation data, the digital replica of the value chain entity providing for substantially real-time representation of the value chain entity and providing for simulation of a possible future state of the value chain entity via the simulation data; wherein the digital replica of the value chain entity is configured to accept a modeling command from a user of the information technology system to facilitate simulation of the value chain entity, the digital twin system being configured to adjust the digital replica in response to the modeling command; and wherein the machine learning model is configured to predict the modeling command and suggest the predicted modeling command to the user based on the sensor data, prior modeling commands, and simulation of the value chain entity.

[1793] In embodiments, an information technology system leveraging digital twins in a value chain having a plurality of value chain entities, the information technology system comprising: a plurality of sensors positioned in, on, and/or near a value chain entity of the value chain entities and configured to collect sensor data related to the value chain entity, the sensor data being substantially real-time sensor data; and an adaptive intelligence system connected to the plurality of sensors and

configured to receive the sensor data from the plurality of sensors, the adaptive intelligence system including: an artificial intelligence system configured to input the sensor data into a machine learning model, the sensor data being used as training data for the machine learning model, the machine learning model being configured to transform the sensor data into simulation data; and a digital twin system configured to create a digital replica of the value chain entity based on the simulation data, the digital replica of the value chain entity providing for substantially real-time representation of the value chain entity and providing for simulation of a possible future state of the value chain entity via the simulation data; wherein the machine learning model is configured to determine which instances of the sensor data to include in transformation into the simulation data based on training of the machine learning model.

[1794] In embodiments, an information technology system leveraging digital twins in a value chain having a plurality of value chain entities, the information technology system comprising: a plurality of sensors positioned in, on, and/or near a value chain entity of the value chain entities and configured to collect sensor data related to the value chain entity, the sensor data being substantially real-time sensor data; and an adaptive intelligence system connected to the plurality of sensors and configured to receive the sensor data from the plurality of sensors, the adaptive intelligence system including: an artificial intelligence system configured to input the sensor data into a machine learning model, the sensor data being used as training data for the machine learning model, the machine learning model being configured to transform the sensor data into simulation data; and a digital twin system configured to create a digital replica of the value chain entity based on the simulation data, the digital replica of the value chain entity providing for substantially real-time representation of the value chain entity and providing for simulation of a possible future state of the value chain entity via the simulation data; wherein the machine learning model is configured to provide a plurality of sets of hypothetical simulation data to the digital twin system based on training of the machine learning model, the digital twin system being configured to create a set of hypothetical digital replicas of the value chain entity, each of the hypothetical digital replicas being based on a set of hypothetical simulation data and the simulation data; and wherein the machine learning model is configured to evaluate performance of each hypothetical digital replica of the set of hypothetical digital replicas, determine which hypothetical digital replicas perform better than others of the set of hypothetical digital replicas, and determine why the hypothetical digital replicas that perform better than the others of the set of hypothetical digital replicas perform better than the others of the set of hypothetical digital replicas.

[1795] In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated

for monitoring and management of a set of value chain network entities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods.

[1796] In embodiments, the user interface includes a voice operated assistant. In the embodiments, the user interface includes a digital twin for presenting a visual representation of a set of attributes of a set of value chain network entities.

[1797] In embodiments, the user interface includes an interface for configuring the adaptive intelligence facilities.

[1798] In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise.

[1799] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring data collection system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed data architecture. In embodiments, the set of data storage facilities for storing data collected and

handled by the platform uses a blockchain. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed ledger.

[1800] In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain network entities. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise. In embodiments, the set of applications includes a set of applications of at least two types from among a set of supply chain management application, demand management applications, intelligent product applications and enterprise resource management applications. In embodiments, the set of applications includes an asset management application.

[1801] In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities.

[1802] In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities. In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system

compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors.

[1803] In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors. In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities. In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet

management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.

[1804] In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated for monitoring and management of a set of value chain network entities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a unified database that supports a set of applications of at least two types from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[1805] In embodiments, the unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods is a distributed database.

[1806] In embodiments, the unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods uses a graph database architecture.

[1807] In embodiments, the set of demand management applications includes a demand prediction application. In embodiments, the set of demand management applications includes a demand aggregation application. In embodiments, the set of demand management applications includes a demand activation application. In embodiments, the set of supply chain management applications includes a vendor search application. In embodiments, the set of supply chain management applications includes a route configuration application. In embodiments, the set of supply chain management applications includes a logistics scheduling application.

[1808] In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a cognitive networking system deployed in a supply chain infrastructure facility operated by the

enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise.

[1809] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise.

[1810] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring data collection system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed data architecture. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a blockchain.

[1811] In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed ledger. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain network entities.

[1812] In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise.

[1813] In embodiments, the set of applications includes a set of applications of at least two types from among a set of supply chain management applications, demand management applications, intelligent product applications and enterprise resource management applications. In embodiments, the set of applications includes an asset management application. In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines,

ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities. In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities. In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors. In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors. In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft,

automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities. In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.

[1814] In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated for monitoring and management of a set of value chain network entities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a unified set of data collection systems that support a set of applications of at least two types from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods. In embodiments, the unified set of data collection systems includes a set of crowdsourcing data collection systems. In embodiments, the unified set of data collection systems includes a set of Internet of Things data collection systems. In embodiments, the unified set of data collection systems includes a set of self-configuring sensor systems. In embodiments, the unified set of data collection systems includes a set of data collection systems that interact with a network-connected product. In embodiments, the unified set of data collection systems includes a set of mobile data collectors deployed in a set of value chain network environments operated by an enterprise.

[1815] In embodiments, the unified set of data collection systems includes a set of edge intelligence systems deployed in a set of value chain network environments operated by an enterprise. In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise.

[1816] In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring data collection system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed data architecture. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a blockchain. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed ledger. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain network entities. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise. In embodiments, the set of applications includes a

set of applications of at least two types from among a set of supply chain management applications, demand management applications, intelligent product applications and enterprise resource management applications. In embodiments, the set of applications includes an asset management application.

[1817] In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities.

[1818] In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities. In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors.

[1819] In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation,

indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors. In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities. In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.

[1820] In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated for monitoring and management of a set of value chain network entities; a set of applications integrated with the platform for enabling an enterprise user of the platform to manage a set of value chain network entities from a point of origin to a point of customer use; and

[1821] a unified set of Internet of Things systems that provide coordinated monitoring of a set of applications of at least two types from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[1822] In embodiments, the unified set of Internet of Things systems includes a set of smart home Internet of Things devices to enable monitoring of a set of demand factors and a set of Internet of Things devices deployed in proximity to a set of supply chain infrastructure facilities to enable monitoring of a set of supply factors.

[1823] In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities.

[1824] In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors.

[1825] In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand,

family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors.In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities.

[1826] In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In embodiments, the unified set of Internet of Things systems includes a set of workplace Internet of Things devices to enable monitoring of a set of demand factors for a set of business customers and a set of Internet of Things devices deployed in proximity

to a set of supply chain infrastructure facilities to enable monitoring of a set of supply factors. In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities. In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors.

[1827] In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business

profile, group profile, family profile, declared interest, and inferred interest factors. In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities.

[1828] In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In embodiments, the unified set of Internet of Things systems includes a set of Internet of Things devices to monitor a set of consumer goods stores to enable monitoring of a set of demand factors for a set of consumers and a set of Internet of Things devices deployed in proximity to a set of supply chain infrastructure facilities to enable monitoring of a set of supply factors. In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce

sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities. In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors. In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors. In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities. In embodiments, the set of applications

involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise.

[1829] In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise.

[1830] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring data collection system deployed in a supply chain infrastructure facility operated by

the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed data architecture. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a blockchain. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed ledger.

[1831] In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain network entities. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise. In embodiments, the set of applications includes a set of applications of at least two types from among a set of supply chain management applications, demand management applications, intelligent product applications and enterprise resource management applications. In embodiments the set of applications includes an asset management application.

[1832] In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities.

[1833] In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities. In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty,

import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors.

[1834] In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors. In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities. In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-

configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.

[1835] In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated for monitoring and management of a set of value chain network entities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and for a set of applications of at least two types from among a set of supply chain applications, a set of demand management applications, a set of intelligent product applications and a set of enterprise resource management applications and having a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, the set of supply chain applications and demand management applications is selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In

embodiments, the set of supply chain applications and demand management applications is selected from the group consisting of inventory management, demand prediction, demand aggregation, pricing, blockchain, smart contract, positioning, placement, promotion, analytics, finance, trading, arbitrage, customer identity management, store planning, shelf-planning, customer route planning, customer route analytics, commerce, ecommerce, payments, customer relationship management, sales, marketing, advertising, bidding, customer monitoring, customer process monitoring, customer relationship monitoring, collaborative filtering, customer profiling, customer feedback, similarity analytics, customer clustering, product clustering, seasonality factor analytics, customer behavior tracking, customer behavior analytics, product design, product configuration, A/B testing, product variation analytics, augmented reality, virtual reality, mixed reality, customer demand profiling, customer mood, emotion or affect detection, customer mood, emotion of affect analytics, business entity profiling, customer enterprise profiling, demand matching, location-based targeting, location-based offering, point of sale interface, point of use interface, search, advertisement, entity discovery, entity search, enterprise resource planning, workforce management, customer digital twin, product pricing, product bundling, product and service bundling, product assortment, upsell offer configuration, customer feedback engagement, and customer survey applications. In embodiments, the set of supply chain applications and demand management applications is selected from the group consisting of supply chain, asset management, risk management, inventory management, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, supply chain digital twin, vendor profiling, supplier profiling, manufacturer profiling, logistics entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, warehousing, distribution, fulfillment, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In embodiments, the set of supply chain applications and demand management applications is selected from the group consisting of asset management, risk management, inventory management, blockchain, smart contract, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, compatibility testing, compatibility management, incident management, predictive maintenance, monitoring, remote

control, automation, self-configuration, self-healing, self-organization, waste reduction, augmented reality, virtual reality, mixed reality, product design, product configuration, product updating, product maintenance, product support, product testing, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, product digital twin, opportunity matching, search, advertisement, entity discovery, entity search, variation, simulation, user interface, application programming interface, connectivity management, natural language interface, voice/speech interface, robotic interface, touch interface, haptic interface, vision system interface, and enterprise resource planning applications.

[1836] The system of claim 1, wherein the set of supply chain applications and demand management applications is selected from the group consisting of operations, finance, asset management, supply chain management, demand management, human resource management, product management, risk management, regulatory and compliance management, inventory management, infrastructure management, facilities management, analytics, trading, tax, identity management, vendor management, process management, project management, operations management, customer relationship management, workforce management, incident management, research and development, sales management, marketing management, fleet management, opportunity analytics, decision support, strategic planning, forecasting, resource management, and property management applications.

[1837] In embodiments, the machine vision system includes an artificial intelligence system that is trained to recognize a type of value chain asset based on a labeled data set of images of such type of value chain assets.

[1838] In embodiments, the digital twin presents an indicator of the type of asset based on the output of the artificial intelligence system. In embodiments, the machine vision system includes an artificial intelligence system that is trained to recognize a type of activity involving a set of value chain entities based on a labeled data set of images of such type of activity. In embodiments, the digital twin presents an indicator of the type of activity based on the output of the artificial intelligence system. In embodiments, the machine vision system includes an artificial intelligence system that is trained to recognize a safety hazard involving a value chain entity based on a training data set that includes a set of images of value chain network activities and a set of value chain network safety outcomes. In embodiments, the digital twin presents an indicator of the hazard based on the output of the artificial intelligence system. In embodiments, the machine vision system includes an artificial intelligence system that is trained to predict a delay based on a training data set that includes a set of images of value chain network activities and a set of value chain network timing outcomes. In embodiments, the digital twin presents an indicator of a likelihood of

delay based on the output of the artificial intelligence system. In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface.

[1839] In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise.

[1840] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise.

[1841] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring data collection system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise.

[1842] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities.

[1843] In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed data architecture. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a blockchain. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed ledger.

[1844] In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain network entities.

[1845] In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise.

[1846] In embodiments, the set of applications includes a set of applications of at least two types from among a set of supply chain management applications, demand management applications, intelligent product applications and enterprise resource management applications. In embodiments, the set of applications includes an asset management application. In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities. In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities. In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors. In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand,

family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors. In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities.

[1847] In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.

[1848] In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities,

adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated for monitoring and management of a set of value chain network entities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of applications of at least two types from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods. In embodiments, the unified set of adaptive edge computing systems that provide coordinated edge computation includes systems selected from the group consisting of image classification systems, video compression systems, analog-to-digital transformation systems, digital-to-analog transformation systems, RF filtering systems, motion prediction systems, object type recognition systems, point cloud processing systems, analog signal processing systems, multiplexing systems, data filtering systems, statistical signal processing systems, signal filtering systems, signal processing systems, protocol selection systems, storage configuration systems, power management systems, clustering systems, variation systems, machine learning systems, event prediction systems, autonomous control systems, robotic control systems, robotic process automation systems, data visualization systems, data normalization systems, data cleansing system, data deduplication systems, graph-based data storage systems, object-oriented data storage systems, self-configuration systems, self-healing systems, handshake negotiation systems, entity discovery systems, cybersecurity systems, biometric systems, natural language processing systems, sound processing systems, ultrasound processing systems, artificial intelligence systems, rules engine systems, workflow automation systems, opportunity discovery systems, physical modeling systems, testing systems, diagnostic systems, software image propagation systems, peer-to-peer network configuration systems, RF spectrum management systems, network resource management systems, storage management systems, data management systems, intrusion detection systems, firewall systems, virtualization systems, digital twin systems, Internet of Things monitoring systems, routing systems, switching systems, indoor location systems, and geolocation systems. In embodiments, the interface is a user interface for a command center dashboard by which an enterprise orchestrates a set of value chain entities related to a type of product. In embodiments, the interface is a user interface of a local management system located in an environment that hosts a set of value chain entities. In embodiments, the local management system user interface facilitates configuration of a set of network connections for the adaptive edge computing systems. In embodiments, the local management system user interface facilitates configuration of a set of data storage resources for the adaptive edge computing systems.

[1849] In embodiments, the local management system user interface facilitates configuration of a set of data integration capabilities for the adaptive edge computing systems.

[1850] In embodiments, the local management system user interface facilitates configuration of a set of machine learning input resources for the adaptive edge computing systems. In embodiments, the local management system user interface facilitates configuration of a set of power resources that support the adaptive edge computing systems.

[1851] In embodiments, the local management system user interface facilitates configuration of a set of workflows that are managed by the adaptive edge computing systems. In embodiments, the interface is a user interface of a mobile computing device that has a network connection to the adaptive edge computing systems. In embodiments, the interface is an application programming interface. In embodiments, the application programming interface facilitates exchange of data between the adaptive edge computing systems and a cloud-based artificial intelligence system. In embodiments, the application programming interface facilitates exchange of data between the adaptive edge computing systems and a real-time operating system of a cloud data management platform. In embodiments, the application programming interface facilitates exchange of data between the adaptive edge computing systems and a computational facility of a cloud data management platform. In embodiments, the application programming interface facilitates exchange of data between the adaptive edge computing systems and a set of environmental sensors that collect data about an environment that hosts a set of value chain network entities.

[1852] In embodiments, the application programming interface facilitates exchange of data between the adaptive edge computing systems and a set of sensors that collect data about a product. In embodiments, the application programming interface facilitates exchange of data between the adaptive edge computing systems and a set of sensors that collect data published by an intelligent product. In embodiments, the application programming interface facilitates exchange of data between the adaptive edge computing systems and a set of sensors that collect data published by a set of Internet of Things systems that are disposed in an environment that hosts a set of value chain network entities. In embodiments, the set of demand management applications, supply chain applications, intelligent product applications and enterprise resource management applications are selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing,

self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring data collection system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed data architecture. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a blockchain. In embodiments, the set of data storage facilities for storing data collected and handled by the platform

uses a distributed ledger. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain network entities.

[1853] In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise.

[1854] In embodiments, the set of applications includes a set of applications of at least two types from among a set of supply chain management applications, demand management applications, intelligent product applications and enterprise resource management applications. In embodiments, the set of applications includes an asset management application.

[1855] In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities.

[1856] In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities.

[1857] In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker

location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors.

[1858] In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors.

[1859] In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities. In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet

management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.

[1860] In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated for monitoring and management of a set of value chain network entities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[1861] In embodiments, the unified set of adaptive intelligence systems includes systems selected from the group consisting of artificial intelligence systems, neural networks, deep learning systems, model-based systems, expert systems, machine learning systems, rule-based systems, opportunity miners, robotic process automation systems, data transformation systems, data extraction systems, data loading systems, genetic programming systems, image classification systems, video compression systems, analog-to-digital transformation systems, digital-to-analog transformation systems, signal analysis systems, RF filtering systems, motion prediction systems, object type recognition systems, point cloud processing systems, analog signal processing systems, signal multiplexing systems, data fusion systems, sensor fusion systems, data filtering systems, statistical signal processing systems, signal filtering systems, signal processing systems, protocol selection systems, storage configuration systems, power management systems, clustering systems, variation systems, machine learning systems, event prediction systems, autonomous control systems, robotic control systems, robotic process automation systems, data visualization systems, data normalization systems, data cleansing systems, data deduplication systems, graph-based data storage systems, intelligent agent systems, object-oriented data storage systems, self-configuration systems, self-healing systems, self-organizing systems, self-organizing map systems, cost-based routing systems, handshake negotiation systems, entity discovery systems, cybersecurity systems, biometric systems, natural language processing systems, speech processing systems, voice recognition systems, sound processing systems, ultrasound processing systems, artificial intelligence systems, rules engine systems, workflow automation systems, opportunity discovery systems, physical modeling systems, testing systems, diagnostic systems, software image propagation systems, peer-to-peer network configuration systems, RF spectrum management systems, network resource management systems, storage management systems, data management

systems, intrusion detection systems, firewall systems, virtualization systems, digital twin systems, Internet of Things monitoring systems, routing systems, switching systems, indoor location systems, geolocation systems, parsing systems, semantic filtering systems, machine vision systems, fuzzy logic systems, recommendation systems, and dialog management systems. In embodiments, the unified set of adaptive intelligent systems includes a set of artificial intelligence systems. In embodiments, the unified set of adaptive intelligent system includes a set of neural networks. In embodiments, the unified set of adaptive intelligent system includes a set of deep learning systems. In embodiments, the unified set of adaptive intelligent system includes a set of model-based systems. In embodiments, the unified set of adaptive intelligent system includes a set of expert systems. In embodiments, the unified set of adaptive intelligent system includes a set of machine learning systems. In embodiments, the unified set of adaptive intelligent system includes a set of rule-based systems. In embodiments, the unified set of adaptive intelligent system includes a set of opportunity miners. In embodiments, the unified set of adaptive intelligent system includes a set of robotic process automation systems. In embodiments, the unified set of adaptive intelligent system includes a set of data transformation systems. In embodiments, the unified set of adaptive intelligent system includes a set of data extraction systems. In embodiments, the unified set of adaptive intelligent system includes a set of data loading systems. In embodiments, the unified set of adaptive intelligent system includes a set of genetic programming systems. In embodiments, the unified set of adaptive intelligent system includes a set of image classification systems. In embodiments, the unified set of adaptive intelligent system includes a set of video compression systems.

[1862] In embodiments, the unified set of adaptive intelligent system includes a set of analog-to-digital transformation systems. In embodiments, the unified set of adaptive intelligent system includes a set of digital-to-analog transformation systems. In embodiments, the unified set of adaptive intelligent system includes a set of signal analysis systems. In embodiments, the unified set of adaptive intelligent system includes a set of RF filtering systems. In embodiments, the unified set of adaptive intelligent system includes a set of motion prediction systems. In embodiments, the unified set of adaptive intelligent system includes a set of object type recognition systems. In embodiments, the unified set of adaptive intelligent system includes a set of point cloud processing systems. In embodiments, the unified set of adaptive intelligent system includes a set of analog signal processing systems. In embodiments, the unified set of adaptive intelligent system includes a set of signal multiplexing systems. In embodiments, the unified set of adaptive intelligent system includes a set of data fusion systems.

[1863] In embodiments, the unified set of adaptive intelligent system includes a set of sensor fusion systems.

[1864] In embodiments, the unified set of adaptive intelligent system includes a set of data filtering systems.

[1865] In embodiments, the unified set of adaptive intelligent system includes a set of statistical signal processing systems. In embodiments, the unified set of adaptive intelligent system includes a set of signal filtering systems.

[1866] In embodiments, the unified set of adaptive intelligent system includes a set of signal processing systems. In embodiments, the unified set of adaptive intelligent system includes a set of protocol selection systems. In embodiments, the unified set of adaptive intelligent system includes a set of storage configuration systems. In embodiments, the unified set of adaptive intelligent system includes a set of power management systems. In embodiments, the unified set of adaptive intelligent system includes a set of clustering systems. In embodiments, the unified set of adaptive intelligent system includes a set of variation systems. In embodiments, the unified set of adaptive intelligent system includes a set of machine learning systems.

[1867] In embodiments, the unified set of adaptive intelligent system includes a set of event prediction systems. In embodiments, the unified set of adaptive intelligent system includes a set of autonomous control systems. In embodiments, the unified set of adaptive intelligent system includes a set of robotic control systems. In embodiments, the unified set of adaptive intelligent system includes a set of robotic process automation systems. In embodiments, the unified set of adaptive intelligent system includes a set of data visualization systems. In embodiments, the unified set of adaptive intelligent system includes a set of data normalization systems. In embodiments, the unified set of adaptive intelligent system includes a set of data cleansing systems.

[1868] In embodiments, the unified set of adaptive intelligent system includes a set of data deduplication systems. In embodiments, the unified set of adaptive intelligent system includes a set of graph-based data storage systems. In embodiments, the unified set of adaptive intelligent system includes a set of intelligent agent systems. In embodiments, the unified set of adaptive intelligent system includes a set of object-oriented data storage systems. In embodiments, the unified set of adaptive intelligent system includes a set of self-configuration systems. In embodiments, the unified set of adaptive intelligent system includes a set of self-healing systems. In embodiments, the unified set of adaptive intelligent system includes a set of self-organizing systems.

[1869] In embodiments, the unified set of adaptive intelligent system includes a set of self-organizing map systems. In embodiments, the unified set of adaptive intelligent system includes a set of cost-based routing systems. In embodiments, the unified set of adaptive intelligent system includes a set of handshake negotiation systems. In embodiments, the unified set of adaptive intelligent system includes a set of entity discovery systems. In embodiments, the unified set of

adaptive intelligent system includes a set of cybersecurity systems. In embodiments, the unified set of adaptive intelligent system includes a set of biometric systems. In embodiments, the unified set of adaptive intelligent system includes a set of natural language processing systems. In embodiments, the unified set of adaptive intelligent system includes a set of speech processing systems. In embodiments, the unified set of adaptive intelligent system includes a set of voice recognition systems.

[1870] In embodiments, the unified set of adaptive intelligent system includes a set of sound processing systems.

[1871] In embodiments, the unified set of adaptive intelligent system includes a set of ultrasound processing systems. In embodiments, the unified set of adaptive intelligent system includes a set of artificial intelligence systems.

[1872] In embodiments, the unified set of adaptive intelligent system includes a set of rules engine systems.

[1873] In the embodiments, the unified set of adaptive intelligent system includes a set of workflow automation systems.

[1874] In embodiments, the unified set of adaptive intelligent system includes a set of opportunity discovery systems.

[1875] In embodiments, the unified set of adaptive intelligent system includes a set of physical modeling systems.

[1876] In embodiments, the unified set of adaptive intelligent system includes a set of testing systems.

[1877] In embodiments, the unified set of adaptive intelligent system includes a set of diagnostic systems.

[1878] In embodiments, the unified set of adaptive intelligent system includes a set of software image propagation systems. In embodiments, the unified set of adaptive intelligent system includes a set of peer-to-peer network configuration systems. In embodiments, the unified set of adaptive intelligent system includes a set of RF spectrum management systems. In embodiments, the unified set of adaptive intelligent system includes a set of network resource management systems. In embodiments, the unified set of adaptive intelligent system includes a set of storage management systems. In embodiments, the unified set of adaptive intelligent system includes a set of data management systems. In embodiments, the unified set of adaptive intelligent system includes a set of intrusion detection systems. In embodiments, the unified set of adaptive intelligent system includes a set of firewall systems. In embodiments, the unified set of adaptive intelligent system includes a set of virtualization systems. In embodiments, the unified set of adaptive intelligent system includes a set of digital twin systems.

[1879] In embodiments, the unified set of adaptive intelligent system includes a set of Internet of Things monitoring systems. In embodiments, the unified set of adaptive intelligent system includes a set of routing systems.

[1880] In embodiments, the unified set of adaptive intelligent system includes a set of switching systems.

[1881] In embodiments, the unified set of adaptive intelligent system includes a set of indoor location systems.

[1882] In embodiments, the unified set of adaptive intelligent system includes a set of geolocation systems.

[1883] In embodiments, the unified set of adaptive intelligent system includes a set of parsing systems.

[1884] In embodiments, the unified set of adaptive intelligent system includes a set of semantic filtering systems.

[1885] In embodiments, the unified set of adaptive intelligent system includes a set of machine vision systems.

[1886] In embodiments, the unified set of adaptive intelligent system includes a set of fuzzy logic systems.

[1887] In embodiments, the unified set of adaptive intelligent system includes a set of recommendation systems.

[1888] In embodiments, the unified set of adaptive intelligent system includes a set of dialog management systems.

[1889] In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface. In embodiments, the interface is a user interface for a command center dashboard by which an enterprise orchestrates a set of value chain entities related to a type of product. In embodiments, the interface is a user interface of a local management system located in an environment that hosts a set of value chain entities.

[1890] In embodiments, the local management system user interface facilitates configuration of a set of network connections for the adaptive intelligence systems. In embodiments, the local management system user interface facilitates configuration of a set of data storage resources for the adaptive intelligence systems.

[1891] In embodiments, the local management system user interface facilitates configuration of a set of data integration capabilities for the adaptive intelligence systems. In embodiments, the local management system user interface facilitates configuration of a set of machine learning input resources for the adaptive intelligence systems.

[1892] In embodiments, the local management system user interface facilitates configuration of a set of power resources that support the adaptive intelligence systems. In embodiments, the local management system user interface facilitates configuration of a set of workflows that are managed by the adaptive intelligence systems.

[1893] In embodiments, the interface is a user interface of a mobile computing device that has a network connection to the adaptive intelligence systems. In embodiments, the interface is an application programming interface.

[1894] In embodiments, the application programming interface facilitates exchange of data between the adaptive intelligence systems and a cloud-based artificial intelligence system. In embodiments, the application programming interface facilitates exchange of data between the adaptive intelligence systems and a real-time operating system of a cloud data management platform. In embodiments, the application programming interface facilitates exchange of data between the adaptive intelligence systems and a computational facility of a cloud data management platform. In embodiments, the application programming interface facilitates exchange of data between the adaptive intelligence systems and a set of environmental sensors that collect data about an environment that hosts a set of value chain network entities. In embodiments, the application programming interface facilitates exchange of data between the adaptive intelligence systems and a set of sensors that collect data about a product. In embodiments, the application programming interface facilitates exchange of data between the adaptive intelligence systems and a set of sensors that collect data published by an intelligent product .In embodiments, the application programming interface facilitates exchange of data between the adaptive intelligence systems and a set of sensors that collect data published by a set of Internet of Things systems that are disposed in an environment that hosts a set of value chain network entities. In embodiments, the set of demand management applications, supply chain applications, intelligent product applications and enterprise resource management applications are selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product

maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise.

[1895] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise.

[1896] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring data collection system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise.

[1897] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities.

[1898] In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed data architecture. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a blockchain. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed ledger. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain

network entities. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise. In embodiments, the set of applications includes a set of applications of at least two types from among a set of supply chain management applications, demand management applications, intelligent product applications and enterprise resource management applications.

[1899] In embodiments, the set of applications includes an asset management application. In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities.

[1900] In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities. In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors.

[1901] In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need

for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors. In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities.

[1902] In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network

connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated for monitoring and management of a set of value chain network entities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods. In embodiments, the set of project management facilities are configured to manage a set of projects selected from the set of procurement projects, logistics projects, reverse logistics projects, fulfillment projects, distribution projects, warehousing projects, inventory management projects, product design projects, product management projects, shipping projects, maritime projects, loading or unloading projects, packing projects, purchasing projects, marketing projects, sales projects, analytics projects, demand management projects, demand planning projects, and resource planning projects.

[1903] In embodiments, the project management facilities are configured to manage a set of procurement projects. In embodiments, the project management facilities are configured to manage a set of logistics projects. In embodiments, the project management facilities are configured to manage a set of reverse logistics projects. In embodiments, the project management facilities are configured to manage a set of fulfillment projects. In embodiments, the project management facilities are configured to manage a set of distribution projects. In embodiments, the project management facilities are configured to manage a set of warehousing projects.

[1904] In embodiments, the project management facilities are configured to manage a set of inventory management projects. In embodiments, the project management facilities are configured to manage a set of product design projects. In embodiments, the project management facilities are configured to manage a set of product management projects. In embodiments, the project management facilities are configured to manage a set of shipping projects. In embodiments, the project management facilities are configured to manage a set of maritime projects. In embodiments, the project management facilities are configured to manage a set of loading or unloading projects. In embodiments, the project management facilities are configured to manage a set of packing projects. In embodiments, the project management facilities are configured to manage a set of purchasing projects.

[1905] In embodiments, the project management facilities are configured to manage a set of marketing projects.

[1906] In embodiments, the project management facilities are configured to manage a set of sales projects.

[1907] In embodiments, the project management facilities are configured to manage a set of analytics projects.

[1908] In embodiments, the project management facilities are configured to manage a set of demand management projects. In embodiments, the project management facilities are configured to manage a set of demand planning projects. In embodiments, the project management facilities are configured to manage a set of resource planning projects. In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface. In embodiments, the set of demand management applications, supply chain applications, intelligent product applications and enterprise resource management applications are selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of

adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring data collection system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities.

[1909] In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed data architecture. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a blockchain. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed ledger. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain network entities. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise. In embodiments, the set of applications includes a set of applications of at least two types from among a set of supply chain management applications, demand management applications, intelligent product applications and enterprise resource management applications. In embodiments, the set of applications includes an asset management application. In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities,

drones/robots/AVs, waterways, and port infrastructure facilities. In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities. In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors. In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors. In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities. In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain,

smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.

[1910] In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated for monitoring and management of a set of value chain network entities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[1911] In embodiments, the set of facilities that provide automated recommendations for a set of value chain process tasks provide recommendations involving activities selected from the group consisting of product configuration activities, product selection activities for a customer, supplier selection activities, shipper selection activities, route selection activities, factory selection activities, product assortment activities, product management activities, logistics activities, reverse logistics activities, artificial intelligence configuration activities, maintenance activities, product support activities, product recommendation activities. In embodiments, the automated recommendations relate to a set of product configuration activities. In embodiments, the automated recommendations relate to a set of product selection activities for a customer. In embodiments, the automated recommendations relate to a set of supplier selection activities. In embodiments, the automated recommendations relate to a set of shipper selection activities. In embodiments, the

automated recommendations relate to a set of route selection activities. In embodiments, the automated recommendations relate to a set of factory selection activities. In embodiments, the automated recommendations relate to a set of product assortment activities. In embodiments, the automated recommendations relate to a set of product management activities. In embodiments, the automated recommendations relate to a set of logistics activities. In embodiments, the automated recommendations relate to a set of reverse logistics activities. In embodiments, the automated recommendations relate to a set of artificial intelligence configuration activities. In embodiments, the automated recommendations relate to a set of maintenance activities. In embodiments, the automated recommendations relate to a set of product support activities. In embodiments, the automated recommendations relate to a set of product recommendation activities. In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface. In embodiments, the set of demand management applications, supply chain applications, intelligent product applications and enterprise resource management applications are selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a

cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring data collection system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed data architecture. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a blockchain. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed ledger. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain network entities.

[1912] In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise.

[1913] In embodiments, the set of applications includes a set of applications of at least two types from among a set of supply chain management applications, demand management applications, intelligent product applications and enterprise resource management applications. In embodiments, the set of applications includes an asset management application.

[1914] In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways,

roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities.

[1915] In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities.

[1916] In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors.

[1917] In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors.

[1918] In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear

refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities.

[1919] In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.

[1920] In embodiments, an information technology system including a cloud-based management platform for a value chain network with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated for monitoring and management of a set of value chain network entities; and a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network.

[1921] In embodiments, the set of routing facilities that generate a set of routing instructions for routing information among a set of nodes in the value chain network use a routing system selected from the group consisting of priority-based routing, master controller routing, least cost routing, rule-based routing, genetically programmed routing, random linear network coding routing, traffic-based routing, spectrum-based routing, RF condition-based routing, energy-based routing, latency-sensitive routing, protocol compatibility based routing, dynamic spectrum access routing, peer-to-

peer negotiated routing, and queue-based routing. In embodiments, the routing includes priority-based routing. In embodiments, the routing includes master controller routing. In embodiments, the routing includes least cost routing. In embodiments, the routing includes rule-based routing. In embodiments, the routing includes genetically programmed routing. In embodiments, the routing includes random linear network coding routing. In embodiments, the routing includes traffic-based routing. In embodiments, the routing includes spectrum-based routing. In embodiments, the routing includes RF condition-based routing. In embodiments, the routing includes energy-based routing. In embodiments, the routing includes latency-sensitive routing. In embodiments, the routing includes protocol compatibility-based routing. In embodiments, the routing includes dynamic spectrum access routing. In embodiments, the routing includes peer-to-peer negotiated routing.

[1922] In embodiments, the routing includes queue-based routing. In embodiments, the status information for the value chain network is selected from the group consisting of traffic status, congestion status, bandwidth status, operating status, workflow progress status, incident status, damage status, safety status, power availability status, worker status, data availability status, predicted system status, shipment location status, shipment timing status, delivery status, anticipated delivery status, environmental condition status, system diagnostic status, system fault status, cybersecurity status, compliance status, demand status, supply status, price status, volatility status, need status, interest status, aggregate status for a group or population, and individual status. In embodiments, the status information involves traffic status. In embodiments, the status information involves congestion status. In embodiments, the status information involves bandwidth status. In embodiments, the status information involves operating status. In embodiments, the status information involves workflow progress status. In embodiments, the status information involves incident status. In embodiments, the status information involves damage status. In embodiments, the status information involves safety status. In embodiments, the status information involves power availability status. In embodiments, the status information involves worker status. In embodiments, the status information involves data availability status. In embodiments, the status information involves predicted system status. In embodiments, the status information involves shipment location status. In embodiments, the status information involves shipment timing status. In embodiments, the status information involves delivery status. In embodiments, the status information involves anticipated delivery status. In embodiments, the status information involves environmental condition status. In embodiments, the status information involves system diagnostic status. In embodiments, the status information involves system fault status. In embodiments, the status information involves cybersecurity status. In embodiments, the status information involves compliance status.

[1923] In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface. In embodiments, the set of demand management applications, supply chain applications, intelligent product applications and enterprise resource management applications are selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise .In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise.

[1924] In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring

data collection system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed data architecture. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a blockchain. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed ledger.

[1925] In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain network entities.

[1926] In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise.

[1927] In embodiments, the set of applications includes a set of applications of at least two types from among a set of supply chain management applications, demand management applications, intelligent product applications and enterprise resource management applications. In embodiments, the set of applications includes an asset management application. In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities. In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities. In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability,

component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors. In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors. In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities. In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident

management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.

[1928] In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated for monitoring and management of a set of value chain network entities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, the dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities and workflows and at least one other digital twin represents a set of demand management entities and workflows.

[1929] In embodiments, the entities and workflows relate to a set of products of an enterprise. In embodiments, the entities and workflows relate to a set of suppliers of an enterprise. In embodiments, the entities and workflows relate to a set of producers of a set of products. In embodiments, the entities and workflows relate to a set of manufacturers of a set of products. In embodiments, the entities and workflows relate to a set of retailers of a line of products. In embodiments, the entities and workflows relate to a set of businesses involved in an ecosystem for a category of products. In embodiments, the entities and workflows relate to a set of owners of a set of assets involved in a value chain for a set of products. In embodiments, the entities and workflows relate to a set of operators of a set of assets involved in a value chain for a set of products. In embodiments, the entities and workflows relate to a set of operating facilities. In embodiments, the entities and workflows relate to a set of customers. In embodiments, the entities and workflows relate to a set of consumers. In embodiments, the entities and workflows relate to a set of workers. In embodiments, the entities and workflows relate to a set of mobile devices. In embodiments, the entities and workflows relate to a set of wearable devices. In embodiments, the

entities and workflows relate to a set of distributors. In embodiments, the entities and workflows relate to a set of resellers. In embodiments, the entities and workflows relate to a set of supply chain infrastructure facilities.

[1930] In embodiments, the entities and workflows relate to a set of supply chain processes. In embodiments, the entities and workflows relate to a set of logistics processes. In embodiments, the entities and workflows relate to a set of reverse logistics processes. In embodiments, the entities and workflows relate to a set of demand prediction processes. In embodiments, the entities and workflows relate to a set of demand management processes.

[1931] In embodiments, the entities and workflows relate to a set of demand aggregation processes. In embodiments, the entities and workflows relate to a set of machines. In embodiments, the entities and workflows relate to a set of ships. In embodiments, the entities and workflows relate to a set of barges. In embodiments, the entities and workflows relate to a set of warehouses. In embodiments, the entities and workflows relate to a set of maritime ports. In embodiments, the entities and workflows relate to a set of airports. In embodiments, the entities and workflows relate to a set of airways. In embodiments the entities and workflows relate to a set of waterways. In embodiments, the entities and workflows relate to a set of roadways. In embodiments, the entities and workflows relate to a set of railways. In embodiments, the entities and workflows relate to a set of bridges. In embodiments, the entities and workflows relate to a set of tunnels. In embodiments, the entities and workflows relate to a set of online retailers. In embodiments, the entities and workflows relate to a set of ecommerce sites. In embodiments, the entities and workflows relate to a set of demand factors. In embodiments, the entities and workflows relate to a set of supply factors. In embodiments, the entities and workflows relate to a set of delivery systems. In embodiments, the entities and workflows relate to a set of floating assets. In embodiments, the entities and workflows relate to a set of points of origin. In embodiments, the entities and workflows relate to a set of points of destination. In embodiments, the entities and workflows relate to a set of points of storage. In embodiments the entities and workflows relate to a set of points of product usage. In embodiments the entities and workflows relate to a set of networks. In embodiments, the entities and workflows relate to a set of information technology systems. In embodiments, the entities and workflows relate to a set of software platforms. In embodiments, the entities and workflows relate to a set of distribution centers. In embodiments, the entities and workflows relate to a set of fulfillment centers. In embodiments, the entities and workflows relate to a set of containers.

[1932] In embodiments, the entities and workflows relate to a set of container handling facilities. In embodiments, the entities and workflows relate to a set of customs. In embodiments, the entities and workflows relate to a set of export control. In embodiments, the entities and workflows relate

to a set of border control. In embodiments, the entities and workflows relate to a set of drones. In embodiments, the entities and workflows relate to a set of robots. In embodiments, the entities and workflows relate to a set of autonomous vehicles. In embodiments, the entities and workflows relate to a set of hauling facilities. In embodiments, the entities and workflows relate to a set of drones, robots and autonomous vehicles. In embodiments, the entities and workflows relate to a set of waterways. In embodiments, the entities and workflows relate to a set of port infrastructure facilities.

[1933] In embodiments, the set of digital twins is selected from the set of distribution twins, warehousing twins, port infrastructure twins, shipping facility twins, operating facility twins, customer twins, worker twins, wearable device twins, portable device twins, mobile device twins, process twins, machine twins, asset twins, product twins, point of origin twins, point of destination twins, supply factor twins, maritime facility twins, floating asset twins, shipyard twins, fulfillment twins, delivery system twins, demand factors twins, retailer twins, ecommerce twins, online twins, waterway twins, roadway twins, roadway twins, railway twins, air facility twins, aircraft twins, ship twins, vehicle twins, train twins, autonomous vehicle twins, robotic system twins, drone twins, and logistics factor twins.

[1934] In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface. In embodiments, the set of demand management applications, supply chain applications, intelligent product applications and enterprise resource management applications are selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In

embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise.

[1935] In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring data collection system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise.

[1936] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities.

[1937] In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed data architecture. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a blockchain. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed ledger .In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain network entities. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise. In embodiments, the set of applications includes a set of applications of at least two types from among a set of supply chain

management applications, demand management applications, intelligent product applications and enterprise resource management applications.

[1938] In embodiments, the set of applications includes an asset management application. In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities. In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities.

[1939] In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors.

[1940] In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business

location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors.

[1941] In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities.

[1942] In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.

[1943] In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated for monitoring and management of a set of value chain network entities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a set of microservices layers including an application layer supporting

at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface. In embodiments, the set of demand management applications, supply chain applications, intelligent product applications and enterprise resource management applications are selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.

[1944] In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise .In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise.

[1945] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise.

[1946] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring data collection system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed data architecture. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a blockchain. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed ledger. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain network entities. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise. In embodiments, the set of applications includes a set of applications of at least two types from among a set of supply chain management applications, demand management applications, intelligent product applications and enterprise resource management applications. In embodiments, the set of applications includes an asset management application. In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities,

customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities. In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities.

[1947] In embodiment, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors. In embodiment, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors. In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities. In embodiments, the set of applications involves a set selected from the group consisting of supply

chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.

[1948] In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated for monitoring and management of a set of value chain network entities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities.

[1949] In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface. In embodiments, the set of demand management applications, supply chain applications, intelligent product applications and enterprise resource management applications are selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident

management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.

[1950] In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise.

[1951] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise.

[1952] In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring data collection system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed data architecture. In embodiments, the set of data storage facilities for storing data collected and

handled by the platform uses a blockchain. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed ledger. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain network entities. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise. In embodiments, the set of applications includes a set of applications of at least two types from among a set of supply chain management applications, demand management applications, intelligent product applications and enterprise resource management applications. In embodiments, the set of applications includes an asset management application.

[1953] In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities.

[1954] In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities. In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system

compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors.

[1955] In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors. In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities.

[1956] In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit

management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated for monitoring and management of a set of value chain network entities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface. In embodiments, the set of demand management applications, supply chain applications, intelligent product applications and enterprise resource management applications are selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network

entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise.

[1957] In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring data collection system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed data architecture.

[1958] In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a blockchain. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed ledger. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain network entities.

[1959] In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise.

[1960] In embodiments, the set of applications includes a set of applications of at least two types from among a set of supply chain management applications, demand management applications, intelligent product applications and enterprise resource management applications. In embodiments, the set of applications includes an asset management application. In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers,

manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities. In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities. In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors. In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors. In

embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities.

[1961] In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture; and a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; and a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use.

[1962] In embodiments, the set of interfaces includes a demand management interface and a supply chain management interface. In embodiments, the set of demand management applications, supply chain applications, intelligent product applications and enterprise resource management applications are selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity

management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise.

[1963] In embodiments, the set of network connectivity facilities for enabling a set of value chain network entities to connect to the platform includes a peer-to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a robotic process automation system. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a self-configuring data collection system deployed in a supply chain infrastructure facility operated by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a digital twin system representing attributes of value chain network entity controlled by the enterprise. In embodiments, the set of adaptive intelligence facilities for automating a set of capabilities of the platform includes a smart contract system for automating a set of interactions among a set of value chain network entities. In embodiments, the set of data

storage facilities for storing data collected and handled by the platform uses a distributed data architecture.

[1964] In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a blockchain. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses a distributed ledger. In embodiments, the set of data storage facilities for storing data collected and handled by the platform uses graph database representing a set of hierarchical relationships of value chain network entities.

[1965] In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes an Internet of Things monitoring system. In embodiments, the set of monitoring facilities for monitoring the value chain network entities includes a sensor system deployed in an infrastructure facility operated by an enterprise.

[1966] In embodiments, the set of applications includes a set of applications of at least two types from among a set of supply chain management applications, demand management applications, intelligent product applications and enterprise resource management applications. In embodiments, the set of applications includes an asset management application.

[1967] In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities.

[1968] In embodiments, the platform manages a set of demand factors, a set of supply factors and a set of supply chain infrastructure facilities. In embodiments, the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability,

storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors.

[1969] In embodiments, the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors. In embodiments, the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities.

[1970] In embodiments, the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product

maintenance, product support, product testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.

[1971] In embodiments, an information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities that are coordinated for monitoring and management of a set of value chain network entities; and a set of robotic process automation systems for automating a set of processes in a value chain network, wherein the robotic process automation systems learn on a training set of data involving a set of user interactions with a set of interfaces of a set of software systems that are used to monitor and manage the value chain network entities.

[1972] In embodiments, the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities.

[1973] In embodiments, the process automated by the robotic process automation system involves selection of a vendor for a component. In embodiments, the process automated by the robotic process automation system involves selection of a vendor for a finished goods order. In embodiments, the process automated by the robotic process automation system involves selection of a variation of a product for marketing. In embodiments, the process automated by the robotic process automation system involves selection of an assortment of goods for a shelf.

[1974] In embodiments, the process automated by the robotic process automation system involves determination of a price for a finished good. In embodiments, the process automated by the robotic process automation system involves configuration of a service offer related to a product. In

embodiments, the process automated by the robotic process automation system involves configuration of product bundle. In embodiments, the process automated by the robotic process automation system involves configuration of a product kit. In embodiments, the process automated by the robotic process automation system involves configuration of a product package. In embodiments, the process automated by the robotic process automation system involves configuration of a product display. In embodiments, the process automated by the robotic process automation system involves configuration of a product image. In embodiments, the process automated by the robotic process automation system involves configuration of a product description. In embodiments, the process automated by the robotic process automation system involves configuration of a website navigation path related to a product. In embodiments, the process automated by the robotic process automation system involves determination of an inventory level for a product. In embodiments, the process automated by the robotic process automation system involves selection of a logistics type. In embodiments, the process automated by the robotic process automation system involves configuration of a schedule for product delivery. In embodiments, the process automated by the robotic process automation system involves configuration of a logistics schedule. In embodiments, the process automated by the robotic process automation system involves configuration of a set of inputs for machine learning. In embodiments, the process automated by the robotic process automation system involves preparation of product documentation. In embodiments, the process automated by the robotic process automation system involves preparation of required disclosures about a product. In embodiments, the process automated by the robotic process automation system involves configuration of a product for a set of local requirements. In embodiments, the process automated by the robotic process automation system involves configuration of a set of products for compatibility. In embodiments, the process automated by the robotic process automation system involves configuration of a request for proposals. In embodiments, the process automated by the robotic process automation system involves ordering of equipment for a warehouse.

[1975] In embodiments, the process automated by the robotic process automation system involves ordering of equipment for a fulfillment center. In embodiments, the process automated by the robotic process automation system involves classification of a product defect in an image. In embodiments, the process automated by the robotic process automation system involves inspection of a product in an image. In embodiments, the process automated by the robotic process automation system involves inspection of product quality data from a set of sensors. In embodiments, the process automated by the robotic process automation system involves inspection of data from a set of onboard diagnostics on a. product. In embodiments, the process automated by the robotic process automation system involves inspection of diagnostic data from an Internet of Things

system. In embodiments, the process automated by the robotic process automation system involves review of sensor data from environmental sensors in a set of supply chain environments. In embodiments, the process automated by the robotic process automation system involves selection of inputs for a digital twin. In embodiments, the process automated by the robotic process automation system involves selection of outputs from a digital twin. In embodiments, the process automated by the robotic process automation system involves selection of visual elements for presentation in a digital twin. In embodiments, the process automated by the robotic process automation system involves diagnosis of sources of delay in a supply chain. In embodiments, the process automated by the robotic process automation system involves diagnosis of sources of scarcity in a supply chain. In embodiments, wherein the process automated by the robotic process automation system involves diagnosis of sources of congestion in a supply chain. In embodiments, the process automated by the robotic process automation system involves diagnosis of sources of cost overruns in a supply chain. In embodiments, the process automated by the robotic process automation system involves diagnosis of sources of product defects in a supply chain.

[1976] In embodiments, the process automated by the robotic process automation system involves prediction of maintenance requirements in supply chain infrastructure.

[1977] In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods. In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities;

[1978] a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods. In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities;

[1979] a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a unified set of data collection systems

that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods. In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods. In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities;

[1980] a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a set of supply chain applications for management of a set of demand management applications; and a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[1981] In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[1982] In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods. In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods. In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods. In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network.

[1983] In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring

facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows.

[1984] In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a set of microservices layers including an application layer supporting

at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[1985] In embodiments, a value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments a, value chain network information technology system including a cloud-based management platform with a micro-services architecture, a set of interfaces, network connectivity facilities, adaptive intelligence facilities, data storage facilities, and monitoring facilities; a set of applications for enabling an enterprise to manage a set of value chain network entities from a point of origin to a point of customer use; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[1986] In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[1987] In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a unified set of Internet of Things systems

that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[1988] In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; a set of supply chain applications for management of a set of demand management applications; and

[1989] a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system. In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[1990] In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[1991] In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[1992] In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[1993] In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[1994] In embodiments, value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network.

[1995] In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows.

[1996] In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services.

[1997] In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities.

[1998] In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a set of microservices layers including an

application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities.

[1999] In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2000] In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2001] In embodiments, a value chain network information technology system including a user interface that provides a set of unified views for a set of demand management information and supply chain information for a category of goods; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities.

[2002] In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2003] In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set

of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2004] In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; a set of supply chain applications for management of a set of demand management applications; and a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system.

[2005] In embodiments, value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2006] In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods. In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2007] In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of

supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2008] In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2009] In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network.

[2010] In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows.

[2011] In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services.

[2012] In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of

Internet of Things resources that collect information with respect to supply chain entities and demand management entities.

[2013] In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities.

[2014] In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2015] In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2016] In embodiments, a value chain network information technology system including a unified database that supports a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities.

[2017] In embodiments, a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply

chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2018] In embodiments, a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; a set of supply chain applications for management of a set of demand management applications; and

[2019] a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system.

[2020] In embodiments, a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2021] In embodiments, a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2022] In embodiments, a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2023] In embodiments, a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2024] In embodiments, a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2025] In embodiments, a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network.

[2026] In embodiments, a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows.

[2027] In embodiments a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand

management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services.

[2028] In embodiments, a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities.

[2029] In embodiments, a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities.

[2030] In embodiments, a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2031] In embodiments, a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2032] In embodiments, a value chain network information technology system including a unified set of data collection systems that support a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities.

[2033] In embodiments, a value chain network information technology system including a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; a set of supply chain applications for management of a set of demand management applications; and a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system.

[2034] In embodiments, value chain network information technology system including a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2035] In embodiments, a value chain network information technology system including a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and

[2036] a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2037] In embodiments, a value chain network information technology system including a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of

demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2038] In embodiments, a value chain network information technology system including a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2039] In embodiments, a value chain network information technology system including a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2040] In embodiments, a value chain network information technology system including a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network.

[2041] In embodiments, a value chain network information technology system including a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows.

[2042] In embodiments, a value chain network information technology system including a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand

management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services.

[2043] In embodiments, a value chain network information technology system including a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities.

[2044] In embodiments, a value chain network information technology system including a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities.

[2045] In embodiments, a value chain network information technology system including a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2046] In embodiments, a value chain network information technology system including a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain

application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2047] In embodiments, a value chain network information technology system including a unified set of Internet of Things systems that provide coordinated monitoring of a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities.

[2048] In embodiments, a value chain network information technology system including a set of supply chain applications for management of a set of demand management applications, a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system; and a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2049] In embodiments, a value chain network information technology system including a set of supply chain applications for management of a set of demand management applications, a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system; and a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2050] In embodiments, a value chain network information technology system including a set of supply chain applications for management of a set of demand management applications, a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system; and a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2051] In embodiments, a value chain network information technology system including a set of supply chain applications for management of a set of demand management applications, a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital

twin system; and a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2052] In embodiments, a value chain network information technology system including a set of supply chain applications for management of a set of demand management applications, a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system; and a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2053] In embodiments, a value chain network information technology system including a set of supply chain applications for management of a set of demand management applications, a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system; and a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network.

[2054] In embodiments, a value chain network information technology system including a set of supply chain applications for management of a set of demand management applications, a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system; and a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows.

[2055] In embodiments, a value chain network information technology system including a set of supply chain applications for management of a set of demand management applications, a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services.

[2056] In embodiments, a value chain network information technology system including a set of supply chain applications for management of a set of demand management applications, a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system; and a set of microservices layers including an application layer supporting at least

one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities.

[2057] In embodiments, a value chain network information technology system including a set of supply chain applications for management of a set of demand management applications, a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities.

[2058] In embodiments, a value chain network information technology system including a set of supply chain applications for management of a set of demand management applications, a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2059] In embodiments, a value chain network information technology system including a set of supply chain applications for management of a set of demand management applications, a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system; and

[2060] a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities .In embodiments, a value chain network information technology system including a set of supply chain applications for management of a set of demand management applications, a machine vision system and a digital twin system, wherein the machine vision system feeds data to the digital twin system; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities.

[2061] In embodiments, a value chain network information technology system including a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2062] In embodiments, a value chain network information technology system including a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2063] In embodiments, a value chain network information technology system including a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2064] In embodiments, a value chain network information technology system including a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2065] In embodiments, a value chain network information technology system including a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product

applications and a set of enterprise resource management applications for a category of goods; and a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network.

[2066] In embodiments, a value chain network information technology system including a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows.

[2067] In embodiments, a value chain network information technology system including a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services.

[2068] In embodiments, a value chain network information technology system including a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities.

[2069] In embodiments, a value chain network information technology system including a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities.

[2070] In embodiments, a value chain network information technology system including a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2071] In embodiments, a value chain network information technology system including a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2072] In embodiments, a value chain network information technology system including a unified set of adaptive edge computing systems that provide coordinated edge computation for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities.In embodiments, a value chain network information technology system including a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2073] In embodiments, a value chain network information technology system including a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management

applications for a category of goods; and a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2074] In embodiments, a value chain network information technology system including a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2075] In embodiments, a value chain network information technology system including a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network.

[2076] In embodiments, a value chain network information technology system including a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows.In embodiments, a value chain network information technology system including a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management

application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services.

[2077] In embodiments, a value chain network information technology system including a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities.

[2078] In embodiments, a value chain network information technology system including a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities.

[2079] In embodiments, a value chain network information technology system including a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2080] In embodiments, a value chain network information technology system including a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management

application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2081] In embodiments, a value chain network information technology system including a unified set of robotic process automation systems that provide coordinated automation among at least two types of applications from among a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities.

[2082] In embodiments, a value chain network information technology system including a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2083] In embodiments, a value chain network information technology system including a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods.

[2084] In embodiments, a value chain network information technology system including a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network.

[2085] In embodiments, a value chain network information technology system including a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows.

[2086] In embodiments, a value chain network information technology system including a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services.

[2087] In embodiments, a value chain network information technology system including a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities.

[2088] In embodiments, a value chain network information technology system including a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities.

[2089] In embodiments, a value chain network information technology system including a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and

a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2090] In embodiments, a value chain network information technology system including a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a unified set of adaptive intelligence systems that provide coordinated intelligence for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, a value chain network information technology system including a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods. In embodiments, a value chain network information technology system including a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network

based on current status information for the value chain network. In embodiments, a value chain network information technology system including a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows. In embodiments, a value chain network information technology system including a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services. In embodiments, a value chain network information technology system including a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In

embodiments, a value chain network information technology system including a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2091] In embodiments, a value chain network information technology system including a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a set of project management facilities that provide automated recommendations for a set of value chain project management tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, a value chain network information technology system including a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network. In embodiments, a value chain network information technology system including a set of facilities that provide

automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows.

[2092] In embodiments, a value chain network information technology system including a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services.

[2093] In embodiments, a value chain network information technology system including a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities.

[2094] In embodiments, a value chain network information technology system including a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities.

[2095] In embodiments, a value chain network information technology system including a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2096] In embodiments, a value chain network information technology system including a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2097] In embodiments, a value chain network information technology system including a set of facilities that provide automated recommendations for a set of value chain process tasks based on processing current status information and a set of outcomes for a set of demand management applications, a set of supply chain applications, a set of intelligent product applications and a set of enterprise resource management applications for a category of goods; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities.

[2098] In embodiments, a value chain network information technology system including a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network; and a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows.

[2099] In embodiments, a value chain network information technology system including a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services.

[2100] In embodiments, a value chain network information technology system including a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities.

[2101] In embodiments, a value chain network information technology system including a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities.

[2102] In embodiments, a value chain network information technology system including a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2103] In embodiments, a value chain network information technology system including a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network

based on current status information for the value chain network; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2104] In embodiments, a value chain network information technology system including a management platform for a value chain network, wherein a set of routing facilities generate a set of routing instructions for routing information among a set of nodes in the value chain network based on current status information for the value chain network; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities.

[2105] In embodiments, a value chain network information technology system including a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services.

[2106] In embodiments, a value chain network information technology system including a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities.

[2107] In embodiments, a value chain network information technology system including a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, a value chain network

information technology system including a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a dashboard for managing a set of digital twins, wherein at least one digital twin represents a set of supply chain entities, workflows and assets and at least one other digital twin represents a set of demand management entities and workflows; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services; and a set of microservices layers including an application layer supporting at least one supply chain application

and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities .In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the applications of the application layer use a common set of services among a set of data processing services, data collection services, and data storage services; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities.

[2108] In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data

collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of Internet of Things resources that collect information with respect to supply chain entities and demand management entities; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities.

[2109] In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities; and a set of microservices layers including an application layer supporting at least one supply chain application

and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities. In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of social network sources that provide information with respect to supply chain entities and demand management entities; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities; and a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities.

[2110] In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities; and a machine learning/artificial intelligence system configured to generate recommendations for placing an

additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities. In embodiments, a value chain network information technology system including a set of microservices layers including an application layer supporting at least one supply chain application and at least one demand management application, wherein the microservice layers include a data collection layer that collects information from a set of crowdsourcing resources that provide information with respect to supply chain entities and demand management entities; and a machine learning/artificial intelligence system configured to generate recommendations for placing an additional sensor/and or camera on and/or in proximity to a value chain entity and wherein data from the additional sensor and/or camera feeds into a digital twin that represents a set of value chain entities.

[2111] In embodiments, a value chain network management platform, comprising: a machine learning system that trains one or more machine-learned models to output an e-commerce recommendation to a value chain network customer using training data comprising product features and outcomes; and an artificial intelligence system that receives a request for a recommendation from an e-commerce system, generates the recommendation based on the one or more machine-learned models and the request, and leverages one or more product digital twins and one or more customer profile digital twins to execute a simulation based on the one or more customer profile digital twins and one or more product digital twins. In embodiments, the machine learning system integrates with a model interpretability system, and wherein the model interpretability system is configured to implement Testing with Concept Activation Vectors (TCAV) functionality, whereby the model interpretability facilitates learning of human-interpretable concepts by the machine-learned model .In embodiments, the one or more machine-learned models are trained and/or retrained using simulation data from one or more simulations involving one or more customer profile digital twins.

[2112] In embodiments, a value chain network management platform comprising: a machine learning system that trains one or more machine-learned models to determine an advertising decision using training data comprising advertising features and outcomes; and an artificial intelligence system that receives a request for an advertising-related decision from an advertising system, determines a decision based on the one or more machine-learned models and the request, and leverages one or more advertisement digital twins and one or more customer digital twins to execute a simulation based on the one or more customer digital twins and the one or more advertisement digital twins. In embodiments, the machine learning system integrates with a model interpretability system, and wherein the model interpretability system is configured to implement Testing with Concept Activation Vectors (TCAV) functionality, whereby the model

interpretability facilitates learning of human-interpretable concepts by the machine learning model. In embodiments, the one or more machine-learned models are trained and/or retrained using simulation data from one or more simulations involving one or more customer digital twins.

[2113] In embodiments, a value chain network management platform comprising: a machine learning system that trains one or more machine-learned models to determine an advertising decision using training data comprising advertising features and outcomes; and an artificial intelligence system that receives a request for an advertising-related decision from an advertising system, determines a decision based on the one or more machine-learned models and the request, and leverages one or more advertisement digital twins and one or more customer profile digital twins to execute a simulation based on the one or more customer profile digital twins and the one or more advertisement digital twins. In embodiments, the machine learning system integrates with a model interpretability system, and wherein the model interpretability system is configured to implement Testing with Concept Activation Vectors (TCAV) functionality, whereby the model interpretability facilitates learning of human-interpretable concepts by the machine learning model. In embodiments, the value chain network management platform of claim 1, wherein the one or more machine-learned models are trained and/or retrained using simulation data from one or more simulations involving one or more customer profile digital twins.

[2114] In embodiments, a value chain network management platform comprising: a machine learning system that trains one or more machine-learned models to determine a demand management decision using training data comprising demand features and outcomes; and an artificial intelligence system that receives a request for a demand management decision from a demand management system, determines a decision based on the one or more machine-learned models and the request, and leverages one or more customer digital twins to execute a simulation based on the one or more customer digital twins and the demand management decision.

[2115] In embodiments, the machine learning system integrates with a model interpretability system, and wherein the model interpretability system is configured to implement Testing with Concept Activation Vectors (TCAV) functionality, whereby the model interpretability facilitates learning of human-interpretable concepts by the machine learning model. In embodiments, the one or more machine-learned models are trained and/or retrained using simulation data from one or more simulations involving one or more customer digital twins.

[2116] In embodiments, a value chain network management platform comprising: a machine learning system that trains one or more machine-learned models to determine a demand management decision using training data comprising demand features and outcomes; and an artificial intelligence system that receives a request for a demand management decision from a demand management system, determines a decision based on the one or more machine-learned

models and the request, and leverages one or more customer profile digital twins to execute a simulation based on the one or more customer profile digital twins and the demand management decision.

[2117] In embodiments, the machine learning system integrates with a model interpretability system, and wherein the model interpretability system is configured to implement Testing with Concept Activation Vectors (TCAV) functionality, whereby the model interpretability facilitates learning of human-interpretable concepts by the machine learning model. In embodiment the one or more machine-learned models are trained and/or retrained using simulation data from one or more simulations involving one or more customer profile digital twins.

[2118] In embodiments, a value chain network management platform comprising: a machine learning system that trains one or more machine-learned models to determine a demand management decision using training data comprising demand features and outcomes; and an artificial intelligence system that receives a request for a demand management decision from a demand management system, determines a decision based on the one or more machine-learned models and the request, and leverages one or more household demand digital twins to execute a simulation based on the one or more household demand digital twins and the demand management decision.

[2119] In embodiments, the one or more machine-learned models are trained and/or retrained using simulation data from one or more simulations involving one or more household demand digital twins.

[2120] In embodiments, a value chain network management platform comprising: a machine learning system that trains one or more machine-learned models to output and risk management decision using training data comprising component features and outcomes; and an artificial intelligence system that receives a request for a risk management decision from a risk management system, determines a decision based on the one or more machine-learned models and the request, and leverages a set of component digital twins representing product components to execute one or more simulations based on the component digital twins. In embodiments, the component digital twins are arranged and interact in a product configuration. In embodiments, the risk management decision relates to the condition of the component. In embodiments, the one or more machine-learned models are trained and/or retrained using simulation data from one or more simulations involving one or more components.

[2121] In embodiments, an information technology system comprising: a value chain network management platform having an asset management application associated with one or more ships; a data handling layer of the management platform including data sources containing information used to populate a training set based on a set of maritime activities of one or more of the ships and

one of design outcomes, parameters, and data associated with the one or more of the ships; an artificial intelligence system that is configured to learn on the training set collected from the data sources, that simulates one or more design attributes of one or more of the ships, and that generates one or more sets of design recommendations based on the training set collected from the data sources;

[2122] a digital twin system included in the value chain network management platform that provides for visualization of a digital twin of one or more of the ships including detail generated by the artificial intelligence system of one or more of the design attributes in combination with the one or more sets of design recommendations.

[2123] In embodiments, one or more of the ships include one or more container ships, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the container ships including one or more of the attributes in combination with one or more of the sets of recommendations associated with the container ships. In embodiments, one or more of the container ships are moored to a component of port infrastructure. In embodiments, wherein one or more of the ships are connected to a barge.

[2124] In embodiments, the digital twin is configured to provide further visualization of a navigation course relative to a planned course and one or more of the sets of recommendations from the artificial intelligence system for a change in the navigation course associated with one or more of the ships. In embodiments, the digital twin is configured to provide further visualization of an engine performance of one or more of the ships and one or more of the sets of recommendations from the artificial intelligence system for a change in the engine performance. In embodiments, the visualization of the engine performance includes an emissions profile of one or more of the ships. In embodiments, the digital twin is configured to provide further visualization of a hull integrity of one or more of the ships and one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of a hull of one or more of the ships. In embodiments, the digital twin is configured to provide further visualization of in-situ hydrodynamic changes to a portion of a hull disposed below a water line of one or more of the ships and one or more of the sets of recommendations from the artificial intelligence system for a change in a hydrodynamic surface to change performance of one or more of the ships. In embodiments, the digital twin is configured to determine a schedule for the change to the hydrodynamic surface of the hull disposed below the waterline of one or more of the ships to improve fuel efficiency based on known routes of travel and weather patterns. In embodiments, the digital twin is configured to provide further visualization of in-situ aerodynamic changes to a portion of a hull disposed above a water line of one or more of the ships and one or more of the sets of recommendations from the artificial intelligence system for a change in an aerodynamic

surface to change performance of one or more of the ships. In embodiments, the digital twin is configured to determine a schedule for the change to the aerodynamic surface disposed above the waterline of one or more of the ships to improve fuel efficiency using known routes of travel and historical weather patterns. In embodiments, the digital twin is configured to provide further visualization of extendable buoyant members from a hull of one or more of the ships to improve stability during certain maneuvers and one or more of the sets of recommendations from the artificial intelligence system for a change in the extendable buoyant members to change performance of one or more of the ships. In embodiments, the digital twin is configured to provide further visualization of a plurality of inspection points on one or more of the ships and maintenance histories associated with those inspection points. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points. In embodiments, the digital twin is configured to provide further visualization of the plurality of inspection points on the ship affected by travel within a geofenced area and maintenance histories associated with those inspection points. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points. In embodiments, the digital twin is configured to provide details of a ledger of activity associated with the visualization of the plurality of inspection points on one or more of the ships affected by travel within a geofenced area and maintenance histories associated with those inspection points.

[2125] In embodiments, the digital twin is configured to provide for visualization for a first user of one of a navigation course and an engine performance of one more of the ships within a first geofenced area and for visualization for a second user of one of the navigation course and the engine performance of one or more the ships within a second different geofenced area and where transit between the first and second geofenced areas motivates a handoff of one or more of the ships visualized by the digital twin of one or more of the ships between the first user and the second user. In embodiments, the digital twin is configured to at least partially represent one or more of the ships associated with an event investigation and to at least partially detail a timeline of the event investigation and associated ships. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the associated ships. In embodiments, the digital twin is configured to at least partially represent one or more of the ships associated with a legal proceeding and to at least partially detail at least a portion of a timeline pertinent to the legal proceeding and associated ships. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes

of the associated ships. In embodiments, the digital twin is configured to at least partially represent one or more of the ships associated with a casualty forecast and to at least partially detail at least a portion of a timeline pertinent to the casualty report and associated ships.In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the associated ships to reduce exposure relative to a set of previous casualty forecasts. In embodiments, the data collected by a value chain network management platform facilitates identifying theft at or misuse of physical items one of the ships by correlating data between a set of data collectors for one or more physical items in one of the ships and the digital twin detailing one or more of the physical items associated with one of the ships for the at least one of the port infrastructure facility and the set of operators. In embodiments, the digital twin details the one or more physical items associated with one of the ships for at least one operator that includes a view of expected states of at least a portion of the one or more physical items. In embodiments, the artificial intelligence system determines a set of geofence parameters, and wherein the digital twin provides further visualization of at least one geofence that integrates representation of one or more of the ships with a representation of a maritime environment adjacent to the geofence. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of one or more of the ships. In embodiments, one or more of the ships are capable of carrying cargo, wherein the artificial intelligence system determines a set of geofence parameters, and wherein the digital twin provides further visualization of at least one geofence that integrates representation of one or more of the ships capable of carrying cargo with a representation of a maritime environment. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of one or more of the ships capable of carrying cargo. In embodiments, the maritime activities include the forward speed of one or more of the ships relative to water and weather conditions based on the parameters associated with energy consumption of the propulsion units on one or more of the ships.

[2126] In embodiments, an information technology system comprising: a value chain network management platform for learning on a training set of design outcomes, parameters, and data collected from data sources relating to a set of shipping activities to train an artificial intelligence system to simulate attributes of a container ship and generate a set of recommendations of changes to the attributes using a digital twin of the container ship.

[2127] In embodiments, the container ship is moored to port infrastructure installed on or adjacent to land.

[2128] In embodiments, the shipping activities include the forward speed of the container ship relative to water and weather conditions based on the parameters associated with energy consumption of propulsion units on the container ship. In embodiments, further comprising an asset management application associated with one or more maritime facilities connected to the container ship. In embodiments, the asset management application is associated with one or more ships connected to barges. In embodiments, the digital twin of the container ship provides for visualization of a navigation course of the container ship.

[2129] In embodiments, the digital twin of the container ship provides for visualization of an engine performance of the container ship. In embodiments, the digital twin of the container ship provides for visualization of a hull integrity of the container ship. In embodiments, the digital twin of the container ship provides for visualization of in-situ hydrodynamic changes to a portion of a hull disposed below a water line of the container ship. In embodiments, the digital twin of the container ship determines a schedule of the in-situ hydrodynamic changes to the portion of the hull disposed below the waterline of the container ship to improve fuel efficiency using known routes of travel and historical weather patterns. In embodiments, the digital twin of the container ship provides for visualization of in-situ aerodynamic changes to a portion of a hull disposed above a water line of the container ship.

[2130] In embodiments, the digital twin of the container ship determines a schedule of in-situ aerodynamic changes to the portion of the hull disposed above the waterline of the container ship to improve fuel efficiency using known routes of travel and historical weather patterns. In embodiments, the digital twin of the container ship provides for visualization of extendable buoyant members from a hull of the container ship to improve stability during certain maneuvers of the container ship. In embodiments, the digital twin of the container ship provides for visualization of extendable buoyant members from a hull of the container ship to improve stability during certain maneuvers of the container ship. In embodiments, the digital twin of the container ship provides for visualization of a plurality of inspection points on the container ship and maintenance histories associated with those inspection points. In embodiments, the digital twin of the container ship provides for the visualization of the plurality of inspection points on the container ship affected by travel within a geofenced area and maintenance histories associated with those inspection points when maintenance follows travel through the geofenced area.

[2131] In embodiments, the digital twin of the container ship provides for details of a ledger of activity associated with the visualization of the plurality of inspection points on the container ship affected by travel within a geofenced area and maintenance histories associated with those inspection points when maintenance follows travel through the geofenced area. In embodiments, the digital twin of the container ship provides for visualization for a first user of one of a navigation

course of the container ship and an engine performance of the container ship within a first geofenced area and for visualization for a second user of one of the navigation course of the container ship and the engine performance of the container ship within a second geofenced area and where transit between the first and second geofenced areas motivates a handoff of the digital twin of the container ship between the first user and the second user.

[2132] In embodiments, an information technology system comprising :a value chain network management platform having an asset management application associated with one or more barges; a data handling layer of the management platform including data sources containing information used to populate a training set based on a set of maritime activities of one or more of the barges and one of design outcomes, parameters, and data associated with the one or more of the barges; an artificial intelligence system that is configured to learn on the training set collected from the data sources, that simulates one or more design attributes of one or more of the barges, and that generates one or more sets of design recommendations based on the training set collected from the data sources; a digital twin system included in the value chain network management platform that provides for visualization of a digital twin of one or more of the barges including detail generated by the artificial intelligence system of one or more of the design attributes in combination with the one or more sets of design recommendations.

[2133] In embodiments, the digital twin system further provides for visualization of the digital twin of one or more of the barges including one or more of the attributes in combination with one or more of the sets of recommendations associated with the barges. In embodiments, one of the barges is connected to a ship .In embodiments, the digital twin is configured to provide for visualization of a navigation course of one of the barges relative to a planned course of one of the barges and one or more of the sets of recommendations from the artificial intelligence system for a change in the navigation course of one of the barges .In embodiments, the digital twin is configured to provide for visualization of a hull integrity of one of the barges relative to a planned course of one of the barges and one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the hull of one of the barges. In embodiments, the digital twin is configured to provide for visualization of in-situ hydrodynamic changes to a portion of a hull disposed below a water line of one or more of the barges and one or more of the sets of recommendations from the artificial intelligence system for a change in a hydrodynamic surface to change performance of one or more of the barges. In embodiments, the digital twin is configured to determine a schedule for the change to the hydrodynamic surface of the hull disposed below the waterline of one or more of the barges to improve fuel efficiency based on known routes of travel and weather patterns.

[2134] In embodiments, the digital twin is configured to provide visualizations of extendable buoyant members from a hull of one or more of the barges to improve stability during certain maneuvers of one or more of the barges and one or more of the sets of recommendations from the artificial intelligence system for a change in the extendable buoyant members to change performance of one or more of the barges. In embodiments, the digital twin is configured to provide visualizations of a plurality of inspection points on one or more of the barges and maintenance histories associated with those inspection points. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points. In embodiments, the digital twin is configured to provide for visualizations of the plurality of inspection points on one or more of the barges affected by travel within a geofenced area and maintenance histories associated with those inspection points. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points.

[2135] In embodiments, the digital twin is configured to provide details of a ledger of activity associated with the visualization of the plurality of inspection points on one or more of the barges affected by travel within a geofenced area and maintenance histories associated with those inspection points.

[2136] In embodiments, the digital twin is configured to provide for visualization for a first user of one of a navigation course of one or more of the barges within a first geofenced area and for visualization for a second user of one of the navigation course of one or more of the barges within a second different geofenced area and where transit between the first and second geofenced areas motivates a handoff of the digital twin of one or more of the barges between the first user and the second user. In embodiments, the digital twin is configured to at least partially represent one or more of the barges associated with an event investigation and to at least partially detail a timeline of the event investigation and associated maritime assets. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the associated barges. In embodiments, the digital twin is configured to at least partially represent one or more of the barges associated with a legal proceeding and to at least partially detail at least a portion of a timeline pertinent to the legal proceeding and associated barges. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the associated barges. In embodiment, the digital twin is configured to at least partially represent one or more of the barges associated with a casualty forecast and to at least partially detail at least a portion of a timeline pertinent to the casualty report and associated barges.

In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the associated barges to reduce exposure relative to a set of previous casualty forecasts. In embodiments, the data collected by a value chain network management platform facilitates identifying theft at or misuse of physical items on one of the barges by correlating data between a set of data collectors for one or more physical items on one of the barges and the digital twin detailing the one or more physical items on one of the barges for at least one of a port infrastructure facility and a set of operators.

[2137] In embodiments, the digital twin details the one or more physical items on of the barges for at least one operator that includes a view of expected states of at least a portion of the one or more physical items. In embodiments, the artificial intelligence system determines a set of geofence parameters, and wherein the digital twin provides further visualization of at least one geofence that integrates representation of one or more of the barges with a representation of a maritime environment adjacent to the geofence. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the set of one or more of the barges. In embodiments, the asset management application is associated with one or more ships connected to one of the barges.

[2138] In embodiments, the data handling layer of the management platform includes data sources containing information used to populate the training set based on a set of maritime activities of one or more of the barges underway and each connected to a ship and one of design outcomes, parameters, and data associated with the one or more of the barges and its associated ship. In embodiments, the artificial intelligence system is configured to learn on the training set collected from the data sources and to simulate one or more design attributes of one or more of the barges each connected to a ship. In embodiments, the digital twin system provides for visualization of a digital twin of one or more of the barges and each of the ships to which they are connected.

[2139] In embodiments, an information technology system comprising: a value chain network management platform for learning on a training set of design outcomes, parameters, and data collected from data sources relating to a set of shipping activities to train an artificial intelligence system to simulate attributes of a barge and generate a set of recommendations of changes to the attributes using a digital twin of the barge. In embodiments, the digital twin system further provides for visualization of the digital twin of one or more of the barges including one or more of the attributes in combination with one or more of the sets of recommendations of changes to the attributes associated with the barges. In embodiments, one of the barges is connected to a ship. In embodiments, the digital twin is configured to provide for visualization of a navigation course of one of the barges relative to a planned course of one of the barges and one or more of the sets of

recommendations from the artificial intelligence system for a change in the navigation course of one of the barges. In embodiments, the digital twin is configured to provide for visualization of a hull integrity of one of the barges relative to a planned course of one of the barges and one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the hull of one of the barges. In embodiments, the digital twin is configured to provide for visualization of in-situ hydrodynamic changes to a portion of a hull disposed below a water line of one or more of the barges and one or more of the sets of recommendations from the artificial intelligence system for a change in a hydrodynamic surface to change performance of one or more of the barges. In embodiments, the digital twin is configured to determine a schedule for the change to the hydrodynamic surface of the hull disposed below the waterline of one or more of the barges to improve fuel efficiency based on known routes of travel and weather patterns.

[2140] In embodiments, the digital twin is configured to provide visualizations of extendable buoyant members from a hull of one or more of the barges to improve stability during certain maneuvers of one or more of the barges and one or more of the sets of recommendations from the artificial intelligence system for a change in the extendable buoyant members to change performance of one or more of the barges. In embodiments, the digital twin is configured to provide visualizations of a plurality of inspection points on one or more of the barges and maintenance histories associated with those inspection points. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points.

[2141] In embodiments, the digital twin is configured to provide for visualizations of the plurality of inspection points on one or more of the barges affected by travel within a geofenced area and maintenance histories associated with those inspection points. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points. In embodiments, the digital twin is configured to provide details of a ledger of activity associated with the visualization of the plurality of inspection points on one or more of the barges affected by travel within a geofenced area and maintenance histories associated with those inspection points. In embodiments, the digital twin is configured to provide for visualization for a first user of one of a navigation course of one or more of the barges within a first geofenced area and for visualization for a second user of one of the navigation course of one or more of the barges within a second different geofenced area and where transit between the first and second geofenced areas motivates a handoff of the digital twin of one or more of the barges between the first user and the second user. In embodiments, the digital twin is configured to at least partially represent one or more of the barges associated with an event investigation and to at least partially detail a timeline of the

event investigation and associated maritime assets. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the associated barges. In embodiments, the digital twin is configured to at least partially represent one or more of the barges associated with a legal proceeding and to at least partially detail at least a portion of a timeline pertinent to the legal proceeding and associated barges. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the associated barges. In embodiments, the digital twin is configured to at least partially represent one or more of the barges associated with a casualty forecast and to at least partially detail at least a portion of a timeline pertinent to the casualty report and associated barges. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the associated barges to reduce exposure relative to a set of previous casualty forecasts.

[2142] In embodiments, the data collected by a value chain network management platform facilitates identifying theft at or misuse of physical items on one of the barges by correlating data between a set of data collectors for one or more physical items on one of the barges and the digital twin detailing the one or more physical items on one of the barges for at least one of a port infrastructure facility and a set of operators. In embodiments, the digital twin details the one or more physical items on of the barges for at least one operator that includes a view of expected states of at least a portion of the one or more physical items. In embodiments, the artificial intelligence system determines a set of geofence parameters, and wherein the digital twin provides further visualization of at least one geofence that integrates representation of one or more of the barges with a representation of a maritime environment adjacent to the geofence.

[2143] In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the set of one or more of the barges.

[2144] In embodiments, the asset management application is associated with one or more ships connected to one of the barges. In embodiments, the data handling layer of the management platform includes data sources containing information used to populate the training set based on a set of maritime activities of one or more of the barges underway and each connected to a ship and one of design outcomes, parameters, and data associated with the one or more of the barges and its associated ship. In embodiments, the artificial intelligence system is configured to learn on the training set collected from the data sources and to simulate one or more design attributes of one or more of the barges each connected to a ship. In embodiments, the digital twin system provides for

visualization of a digital twin of one or more of the barges and each of the ships to which they are connected.

[2145] In embodiments, an information technology system comprising: a value chain network management platform having an asset management application associated with port infrastructure; a data handling layer of the management platform including data sources containing information used to populate a training set based on a set of maritime activities around the port infrastructure and one of design outcomes, parameters, and data associated with the port infrastructure; an artificial intelligence system that is configured to learn on the training set collected from the data sources, that simulates one or more attributes of the port infrastructure, and that generates one or more sets of recommendations for a change in the one or more attributes based on the training set collected from the data sources; a digital twin system included in the value chain network management platform that provides for visualization of a digital twin of the port infrastructure including detail generated by the artificial intelligence system of one or more of the attributes in combination with the one or more sets of recommendations. In embodiments, the digital twin system further provides for visualization of the digital twin of one or more of container ships in the port infrastructure including one or more of the attributes in combination with one or more of the sets of recommendations associated with one or more of the container ships. In embodiments, the digital twin system further provides for visualization of the digital twin of one or more of barges in the port infrastructure including one or more of the attributes in combination with one or more of the sets of recommendations associated with one or more of the barges. In embodiments, the port infrastructure includes one or more moored navigation units deployed on water. In embodiments, the port infrastructure includes one or more ships each connected to a barge. In embodiments, the port infrastructure is associated with a real-world maritime port, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the components of the real-world maritime port including one or more of the attributes in combination with one or more of the sets of recommendations associated with the components of the real-world maritime port.

[2146] In embodiments, the port infrastructure is associated with a real-world shipyard, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the components of the real-world shipyard including one or more of the attributes in combination with one or more of the sets of recommendations associated with the components of the real-world shipyard. In embodiments, the digital twin is configured to provide for visualization of an engine performance of the port infrastructure and one or more of the sets of recommendations from the artificial intelligence system for a change in the engine performance installed in the port

infrastructure. In embodiments, the visualization of an engine performance includes an emissions profile.

[2147] In embodiments, the digital twin is configured to provide visualizations of a plurality of inspection points on the port infrastructure and maintenance histories associated with those inspection points. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points. In embodiments, the digital twin is configured to provide for visualizations of the plurality of inspection points on the port infrastructure includes within a geofenced area and maintenance histories associated with those inspection points. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points. In embodiments, the digital twin is configured to provide details of a ledger of activity associated with the visualization of the plurality of inspection points on the port infrastructure includes within a geofenced area and maintenance histories associated with those inspection points. In embodiments, the digital twin is configured to at least partially represent the port infrastructure associated with an event investigation and to at least partially detail a timeline of the event investigation. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the associated port infrastructure. In embodiments, the digital twin is configured to at least partially represent the port infrastructure associated with a legal proceeding and to at least partially detail at least a portion of a timeline pertinent to the legal proceeding. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the associated port infrastructure. In embodiments, the digital twin is configured to at least partially represent the port infrastructure associated with a casualty forecast and to at least partially detail at least a portion of a timeline pertinent to the casualty report and the port infrastructure. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the associated port infrastructure to reduce exposure relative to a set of previous casualty forecasts. In embodiments, the data collected by a value chain network management platform facilitates identifying theft at or misuse at the port infrastructure by correlating data between a set of data collectors for one or more physical items at the port infrastructure and the digital twin detailing the one or more physical items of the port infrastructure for the at least one of a facility at the port infrastructure and the set of operators.

[2148] In embodiments, the digital twin details the one or more physical items at the port infrastructure for at least one operator that includes a view of expected states of at least a portion of the one or more physical items.

[2149] In embodiments, the data collected by a value chain network management platform facilitates identifying theft at or misuse of one or more physical items at the port infrastructure by correlating data between a set of data collectors for the one or more physical items and the digital twin detailing the one or more physical items at the port infrastructure includes for the at least one of a facility at the port infrastructure and the set of operators.

[2150] In embodiments, the digital twin details the one or more physical items at the port infrastructure for at least one operator that includes a view of expected states of at least a portion of the one or more physical items.

[2151] In embodiments, the artificial intelligence system determines a set of geofence parameters, and wherein the digital twin provides further visualization of at least one geofence that integrates representation of at least a portion of the port infrastructure with a representation of a maritime environment adjacent to the geofence.

[2152] In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the port infrastructure.

[2153] In embodiments, one or more components of the port infrastructure are installed on land. In embodiments, the one or more components of the port infrastructure include one or more moored navigation units deployed on water.

[2154] In embodiments, an information technology system comprising: a value chain network management platform for learning on a training set of design outcomes, parameters, and data collected from data sources relating to a set of shipping activities to train an artificial intelligence system to simulate design attributes of a port infrastructure facility and generate a set of design recommendations using a digital twin of the port infrastructure facility.

[2155] In embodiments, the digital twin system further provides for visualization of the digital twin of the port infrastructure facility including one or more of the attributes in combination with one or more of the sets of recommendations of changes to the attributes associated with the port infrastructure facility. In embodiments, the digital twin is configured to provide visualizations of a plurality of inspection points on the port infrastructure facility and maintenance histories associated with those inspection points. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence

system for a change in maintenance of the plurality of inspection points. In embodiments, the digital twin is configured to provide details of a ledger of activity associated with the visualization of the plurality of inspection points on the port infrastructure facility within a geofenced area and maintenance histories associated with those inspection points.

[2156] In embodiments, the digital twin is configured to at least partially represent at least a portion of the port infrastructure facility associated with an event investigation and to at least partially detail a timeline of the event investigation and associated with the port infrastructure facility. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the port infrastructure facility. In embodiments, the digital twin is configured to at least partially represent at least a portion of the port infrastructure facility associated with a legal proceeding and to at least partially detail at least a portion of a timeline pertinent to the legal proceeding and associated with the port infrastructure facility. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the associated port infrastructure facility. In embodiments, the digital twin is configured to at least partially represent at least a portion of the port infrastructure facility associated with a casualty forecast and to at least partially detail at least a portion of a timeline pertinent to the casualty report and associated port infrastructure facility. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of at least a portion of the port infrastructure facility to reduce exposure relative to a set of previous casualty forecasts. In embodiments, the data collected by a value chain network management platform facilitates identifying theft at or misuse of physical items in at least a portion of the port infrastructure facility by correlating data between a set of data collectors for one or more physical items in at least a portion of the port infrastructure facility and the digital twin detailing the one or more physical items in at least a portion of the port infrastructure facility for at least one of the port infrastructure facility and a set of operators. In embodiments, the digital twin details the one or more physical items in the port infrastructure facility for at least one operator that includes a view of expected states of at least a portion of the one or more physical items. In embodiments, the artificial intelligence system determines a set of geofence parameters, and wherein the digital twin provides further visualization of at least one geofence that integrates representation of at least a portion of the port infrastructure facility with a representation of a maritime environment adjacent to the geofence. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of at least a portion of the port infrastructure facility.

[2157] In embodiments, an information technology system comprising: a value chain network management platform having an asset management application associated with maritime assets involved in a maritime event; a data handling layer of the management platform including data sources containing information used to populate a training set based on a set of maritime activities of the maritime assets involved in the maritime event and one of design outcomes, parameters, and data associated with the maritime assets involved in the maritime event; an artificial intelligence system that is configured to learn on the training set collected from the data sources, that simulates one or more design attributes of the maritime assets involved in a maritime event, and that generates one or more sets of design recommendations based on the training set collected from the data sources; a digital twin system included in the value chain network management platform that provides for visualization of a digital twin of the maritime assets involved in a maritime event including detail generated by the artificial intelligence system of one or more of the design attributes in combination with the one or more sets of design recommendations applicable to at least one of the maritime assets involved in the maritime event.

[2158] In embodiments, the maritime assets include one or more container ships involved in the maritime event, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the container ships including one or more of the attributes in combination with one or more of the sets of recommendations associated with the container ships. In embodiments, the maritime assets include one or more barges involved in the maritime event, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the barges including one or more of the attributes in combination with one or more of the sets of recommendations associated with the barges. In embodiments, the maritime assets include one or more components of port infrastructure involved in the maritime event, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the components of port infrastructure including one or more of the attributes in combination with one or more of the sets of recommendations associated with the components of port infrastructure. In embodiments, the maritime assets are associated with a real-world maritime port, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the components of the real-world maritime port involved in the maritime event including one or more of the attributes in combination with one or more of the sets of recommendations associated with the components of the real-world maritime port. In embodiments, the maritime assets are associated with a real-world shipyard, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the components of the real-world shipyard involved in the maritime event including one or more of the attributes in combination with one or more of the sets of recommendations associated with the components of the real-world shipyard.

In embodiments, the digital twin of one or more of the maritime assets is a floating asset twin associated with a ship. In embodiments, the floating asset twin is configured to provide for visualization of a navigation course of the ship involved in the maritime event relative to a planned course of the ship and one or more of the sets of recommendations from the artificial intelligence system for a change in the navigation course of the ship.

[2159] In embodiments, the floating asset twin is configured to provide for visualization of an engine performance of the ship involved in the maritime event and one or more of the sets of recommendations from the artificial intelligence system for a change in the engine performance of the ship. In embodiments, the visualization of an engine performance includes an emissions profile of the ship. In embodiments, the floating asset twin is configured to provide for visualization of a hull integrity of the ship involved in the maritime event and one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the hull of the ship.

[2160] In embodiments, the floating asset twin is configured to provide visualizations of a plurality of inspection points on the ship involved in the maritime event and maintenance histories associated with those inspection points.

[2161] In embodiments, the floating asset twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points associated with the maritime event. In embodiments, the floating asset twin is configured to provide for visualizations of the plurality of inspection points on the ship affected by travel within a geofenced area and maintenance histories associated with those inspection points. In embodiments, the floating asset twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points associated with the maritime event. In embodiments, the floating asset twin is configured to provide details of a ledger of activity associated with the visualization of the plurality of inspection points on the ship involved in the maritime event within a geofenced area and maintenance histories associated with those inspection points. In embodiments, the artificial intelligence system determines a set of geofence parameters, and wherein the digital twin provides further visualization of at least one geofence that integrates representation of a set of the maritime assets involved in the maritime event with a representation of a maritime environment adjacent to the geofence. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the set of maritime assets involved in the maritime event.

[2162] In embodiments, an information technology system comprising: a value chain network management platform for learning on a training set of maritime event outcomes, parameters, and data collected from data sources to train an artificial intelligence system to use a digital twin to facilitate investigation of a maritime event.

[2163] In embodiments, the maritime event outcomes are associated with a real-world shipyard, and wherein the digital twin is configured to detail at least a portion of the real-world shipyard to facilitate investigation of the maritime event. In embodiments, the maritime event outcomes are associated with a real-world maritime port, and wherein the digital twin is configured to detail at least a portion of the real-world maritime port to facilitate investigation of the maritime event. In embodiments, the maritime event outcomes are associated with one or more container ships, and wherein the digital twin is configured to detail one or more of the container ships to facilitate investigation of the maritime event. In embodiments, the maritime event outcomes are associated with one or more barges, and wherein the digital twin is configured to detail one or more of the barges to facilitate investigation of the maritime event. In embodiments, the maritime event outcomes are associated with at least a portion of port infrastructure, and wherein the digital twin is configured to detail at least a portion of the of port infrastructure to facilitate investigation of the maritime event. In embodiments, the digital twin is configured to at least partially represent activity of one or more maritime value chain network entities during a timeline associated with the maritime event.

[2164] In embodiments, the one or more maritime value chain network entities are associated with a legal proceeding and wherein the digital twin is further configured to at least partially represent activity of one or more maritime value chain network entities during a timeline associated with the legal proceeding. In embodiments, the one or more maritime value chain network entities are associated with a legal proceeding and wherein the digital twin is further configured to at least partially represent activity of one or more maritime value chain network entities during a timeline associated with the legal proceeding. In embodiments, the one or more maritime value chain network entities are associated with a casualty forecast and wherein the digital twin is further configured to at least partially represent activity of one or more maritime value chain network entities during a timeline associated with the casualty forecast. In embodiments, one or more of the maritime value chain network entities is a port infrastructure facility, wherein the data collected by the value chain network management platform facilitates identifying theft or misuse of one or more physical items of the port infrastructure facility by correlating data between a set of data collectors for one or more of the physical items in the port infrastructure facility and the digital twin detailing one or more of the physical items of the port infrastructure facility for the at least

one of the port infrastructure facility and the set of operators to further facilitate investigation of the maritime event.

[2165] In embodiments, the maritime event includes a container ship that is moored to port infrastructure installed on or adjacent to land. In embodiments, the maritime event includes at least a container ship having a forward speed relative to water and weather conditions and parameters associated with energy consumption of propulsion units on the container ship. In embodiments, the maritime event includes one or more ships connected to barges.

[2166] In embodiments, the maritime event includes one or more ships, and wherein the digital twin provides for visualization of a navigation course of one or more of the ships during the maritime event. In embodiments, the maritime event includes one or more ships, and wherein the digital twin provides for visualization of an engine performance of one or more of the ships during the maritime event. In embodiments, the maritime event includes one or more ships, and wherein the digital twin provides for visualization of a hull integrity of one or more of the ships involved in the maritime event. In embodiments, the maritime event includes one or more ships, and wherein the digital twin provides for visualization of a plurality of inspection points associated with one or more of the ships and maintenance histories associated with those inspection points. In embodiments, the digital twin further provides for the visualization of the plurality of inspection points associated with one or more of the ships within a geofenced area related to the maritime event and maintenance histories associated with those inspection points. In embodiments, the digital twin further provides for details of a ledger of activity associated with the visualization of the plurality of inspection points associated with one or more of the ships within a geofenced area related to the maritime event and maintenance histories associated with those inspection points.

[2167] In embodiments, an information technology system comprising: a value chain network management platform having an asset management application associated with maritime assets involved in a maritime legal proceeding; a data handling layer of the management platform including data sources containing information used to populate a training set based on a set of maritime activities of the maritime assets involved in the maritime legal proceeding and one of parameters and data associated with the maritime assets involved in the maritime legal proceeding; an artificial intelligence system that is configured to learn on the training set collected from the data sources, that simulates one or more attributes of one or more of the maritime assets involved in the maritime legal proceeding, and that generates one or more sets of recommendations for a change in the one or more attributes based on the training set collected from the data sources; a digital twin system included in the value chain network management platform that provides for visualization of a digital twin of one or more of the maritime assets involved in the maritime legal

proceeding including detail generated by the artificial intelligence system of one or more of the attributes in combination with the one or more sets of recommendations.

[2168] In embodiments, the maritime assets include one or more container ships involved in the maritime legal proceeding, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the container ships including one or more of the attributes in combination with one or more of the sets of recommendations associated with the container ships. In embodiments, the maritime assets include one or more barges involved in the maritime legal proceeding, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the barges including one or more of the attributes in combination with one or more of the sets of recommendations associated with the barges. In embodiments, the maritime assets include one or more components of port infrastructure involved in the maritime legal proceeding, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the components of port infrastructure including one or more of the attributes in combination with one or more of the sets of recommendations associated with the components of port infrastructure. In embodiments, the maritime assets are associated with a real-world maritime port, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the components of the real-world maritime port involved in the maritime legal proceeding including one or more of the attributes in combination with one or more of the sets of recommendations associated with the components of the real-world maritime port. In embodiments, the maritime assets are associated with a real-world shipyard, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the components of the real-world shipyard involved in the maritime legal proceeding including one or more of the attributes in combination with one or more of the sets of recommendations associated with the components of the real-world shipyard. In embodiments, the digital twin of one or more of the maritime assets is a floating asset twin associated with a ship. In embodiments, the floating asset twin is configured to provide for visualization of a navigation course of the ship involved in the maritime legal proceeding relative to a planned course of the ship and one or more of the sets of recommendations from the artificial intelligence system for a change in the navigation course of the ship.

[2169] In embodiments, the floating asset twin is configured to provide for visualization of an engine performance of the ship involved in the maritime legal proceeding and one or more of the sets of recommendations from the artificial intelligence system for a change in the engine performance of the ship. In embodiments, the visualization of an engine performance includes an emissions profile of the ship. In embodiments, the floating asset twin is configured to provide for visualization of a hull integrity of the ship involved in the maritime legal proceeding and one or

more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the hull of the ship. In embodiments, the floating asset twin is configured to provide visualizations of a plurality of inspection points on the ship involved in the maritime legal proceeding and maintenance histories associated with those inspection points. In embodiments, the floating asset twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points associated with the maritime event. In embodiments, the floating asset twin is configured to provide for visualizations of the plurality of inspection points on the ship affected by travel within a geofenced area and maintenance histories associated with those inspection points. In embodiments, the floating asset twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points associated with the maritime event.

[2170] In embodiments, the floating asset twin is configured to provide details of a ledger of activity associated with the visualization of the plurality of inspection points on the ship involved in the maritime legal proceeding within a geofenced area and maintenance histories associated with those inspection points. In embodiments, the artificial intelligence system determines a set of geofence parameters, and wherein the digital twin provides further visualization of at least one geofence that integrates representation of a set of the maritime assets involved in the maritime legal proceeding with a representation of a maritime environment adjacent to the geofence. In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the set of maritime assets involved in the maritime legal proceeding.

[2171] In embodiments, an information technology system comprising: a value chain network management platform for learning on a training set of maritime legal outcomes, parameters, and data collected from data sources to train an artificial intelligence system to use a digital twin to generate a recommendation relating to a maritime legal proceeding.

[2172] In embodiments, the maritime legal outcomes are associated with a real-world shipyard, and wherein the digital twin is configured to detail at least a portion of the real-world shipyard associated with the maritime legal proceeding. In embodiments, the maritime legal outcomes are associated with a real-world maritime port, and wherein the digital twin is configured to detail at least a portion of the real-world maritime port associated with the maritime legal proceeding. In embodiments, the maritime legal outcomes are associated with one or more container ships, and wherein the digital twin is configured to detail at least a portion of the one or more container ships associated with the maritime legal proceeding. In embodiments, the maritime legal outcomes are associated with one or more barges, and wherein the digital twin is configured to detail at least a

portion of the one or more barges associated with the maritime legal proceeding. In embodiments, the maritime legal outcomes are associated with at least a portion of port infrastructure, and wherein the digital twin is configured to detail at least a portion of the port infrastructure associated with the maritime legal proceeding. In embodiments, the digital twin is configured to at least partially represent activity of one or more maritime value chain network entities during a timeline associated with the maritime legal proceeding. In embodiments, one or more of the maritime value chain network entities is a port infrastructure facility, wherein the data collected by the value chain network management platform facilitates identifying theft or misuse of one or more physical items of the port infrastructure facility relating to the maritime legal proceeding by correlating data between a set of data collectors for one or more of the physical items in the port infrastructure facility, wherein the digital twin is configured to further detail one or more of the physical items of the port infrastructure facility for the at least one of the port infrastructure facility and the set of operators. In embodiments the maritime legal proceeding includes a situation involving a container ship that is moored to port infrastructure installed on or adjacent to land. In embodiments, the maritime legal proceeding includes a situation involving a container ship having a forward speed relative to water and weather conditions and parameters associated with energy consumption of propulsion units on the container ship. In embodiments, the maritime legal proceeding includes a situation involving one or more ships connected to barges. In embodiments, the maritime legal proceeding includes a situation involving one or more ships, and wherein the digital twin provides for visualization of a navigation course of one or more of the ships relevant to the maritime legal proceeding. In embodiments, the maritime legal proceeding includes a situation involving one or more ships, and wherein the digital twin provides for visualization of an engine performance of one or more of the ships relevant to the maritime legal proceeding. In embodiments, wherein the maritime legal proceeding includes a situation involving one or more ships, and wherein the digital twin provides for visualization of a hull integrity of one or more of the ships relevant to the maritime legal proceeding. In embodiments, the maritime legal proceeding includes a situation involving one or more ships, and wherein the digital twin provides for visualization of a plurality of inspection points associated with one or more of the ships and maintenance histories associated with those inspection points. In embodiments, the digital twin further provides for the visualization of the plurality of inspection points associated with one or more of the ships within a geofenced area relevant to the maritime legal proceeding and maintenance histories associated with those inspection points.

[2173] In embodiments, the digital twin further provides for details of a ledger of activity associated with the visualization of the plurality of inspection points associated with one or more

of the ships within a geofenced area relevant to the maritime legal proceeding and maintenance histories associated with those inspection points.

[2174] In embodiments, an information technology system comprising; a value chain network management platform having an asset management application associated with maritime assets; a data handling layer of the management platform including data sources containing information used to populate a training set based on a set of maritime activities of one or more of the maritime assets involved in a loss event and one of outcomes, parameters, and data associated with the one or more maritime assets experiencing the loss event; an artificial intelligence system that is configured to learn on the training set collected from the data sources, that simulates one or more attributes of one or more of the maritime assets, and that generates one or more sets of casualty forecasts based on the training set collected from the data sources; a digital twin system included in the value chain network management platform that provides for visualization of one or more digital twins associated with one or more of the maritime assets involved in the loss event including detail generated by the artificial intelligence system of at least a portion of one of the sets of casualty forecasts. In embodiments, the maritime assets include one or more container ships associated with at least a portion of one of the sets of casualty forecasts, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the container ships including one or more of the attributes in combination with one or more of the sets of recommendations associated with the container ships. In embodiments, the maritime assets include one or more barges with at least a portion of one of the sets of casualty forecasts, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the barges including one or more of the attributes in combination with one or more of the sets of recommendations associated with the barges. In embodiments, the maritime assets include one or more components of port infrastructure with at least a portion of one of the sets of casualty forecasts, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the components of port infrastructure including one or more of the attributes in combination with one or more of the sets of recommendations associated with the components of port infrastructure associated with the sets of casualty forecasts. In embodiments, the maritime assets are associated with a real-world maritime port, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the components of the real-world maritime port associated at least a portion of one of the sets of casualty forecasts including one or more of the attributes in combination with one or more of the sets of recommendations associated with the components of the real-world maritime port. In embodiments, the maritime assets are associated with a real-world shipyard, and wherein the digital twin system further provides for visualization of the digital twin of one or more of the components of the real-world shipyard

associated at least a portion of one of the sets of casualty forecasts including one or more of the attributes in combination with one or more of the sets of recommendations associated with the components of the real-world shipyard. In embodiments, the digital twin of one or more of the maritime assets is a floating asset twin associated with a ship associated with at least a portion of one of the sets of casualty forecasts. In embodiments, the floating asset twin is configured to provide for visualization of a navigation course of the ship associated at least a portion of one of the sets of casualty forecasts relative to a planned course of the ship and one or more of the sets of recommendations from the artificial intelligence system for a change in the navigation course of the ship. In embodiments, the floating asset twin is configured to provide for visualization of an engine performance of the ship associated at least a portion of one of the sets of casualty forecasts and one or more of the sets of recommendations from the artificial intelligence system for a change in the engine performance of the ship. In embodiments, the visualization of an engine performance includes an emissions profile of the ship. In embodiments, the floating asset twin is configured to provide for visualization of a hull integrity of the ship associated at least a portion of one of the sets of casualty forecasts and one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the hull of the ship. In embodiments, the floating asset twin is configured to provide visualizations of a plurality of inspection points on the ship associated with at least a portion of one of the sets of casualty forecasts and maintenance histories associated with those inspection points. In embodiments, the floating asset twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points associated with the maritime event. In embodiments, the floating asset twin is configured to provide for visualizations of the plurality of inspection points on the ship affected by travel within a geofenced area and maintenance histories associated with those inspection points.

[2175] In embodiments, the floating asset twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change in maintenance of the plurality of inspection points associated with the maritime event. In embodiments, the floating asset twin is configured to provide details of a ledger of activity associated with the visualization of the plurality of inspection points on the ship associated at least a portion of one of the sets of casualty forecasts within a geofenced area and maintenance histories associated with those inspection points. In embodiments, the artificial intelligence system determines a set of geofence parameters, and wherein the digital twin provides further visualization of at least one geofence that integrates representation of a set of the maritime assets associated at least a portion of one of the sets of casualty forecasts with a representation of a maritime environment adjacent to the geofence.

[2176] In embodiments, the digital twin is also configured to provide one or more of the sets of recommendations from the artificial intelligence system for a change of one of the attributes of the set of maritime assets associated with at least a portion of one of the sets of casualty forecasts.

[2177] In embodiments, an information technology system comprising: a value chain network management platform for learning on a training set of maritime outcomes, parameters, and data collected from data sources to train an artificial intelligence system to use a digital twin to predict and display a casualty forecast for a set of maritime assets. In embodiments, the set of maritime assets includes a real-world shipyard, and wherein the digital twin is configured to detail at least a portion of the real-world shipyard associated with the casualty forecast.

[2178] In embodiments, the set of maritime assets includes a real-world maritime port, and wherein the digital twin is configured to detail at least a portion of the real-world maritime port associated with the casualty forecast.

[2179] In embodiments, the set of maritime assets includes one or more container ships, and wherein the digital twin is configured to detail at least a portion of the one or more container ships associated with the casualty forecast.

[2180] In embodiments, the set of maritime assets includes one or more barges, and wherein the digital twin is configured to detail at least a portion of the one or more barges associated with the casualty forecast. In embodiments, the set of maritime assets includes at least a portion of port infrastructure, and wherein the digital twin is configured to detail at least a portion of the port infrastructure associated with the casualty forecast. In embodiments the digital twin is configured to at least partially represent activity of the set of maritime assets during a timeline associated with the casualty forecast. In embodiments, the set of maritime assets includes a port infrastructure facility, wherein the data collected by the value chain network management platform facilitates identifying theft or misuse of one or more physical items of the port infrastructure facility relating to the casualty forecast by correlating data between a set of data collectors for one or more of the physical items in the port infrastructure facility, wherein the digital twin is configured to further detail one or more of the physical items of the port infrastructure facility for the at least one of the port infrastructure facility and the set of operators. In embodiments, the set of maritime assets includes a container ship that is moored to port infrastructure installed on or adjacent to land. In embodiments, the set of maritime assets includes one or more ships connected to barges. In embodiments, the set of maritime assets includes one or more ships, and wherein the digital twin provides for visualization of a navigation course of one or more of the ships relevant to the casualty forecast. In embodiments, the set of maritime assets includes one or more ships, and wherein the digital twin provides for visualization of an engine performance of one or more of the ships relevant to the casualty forecast. In embodiments, the set of maritime assets includes one or more ships, and

wherein the digital twin provides for visualization of a hull integrity of one or more the ships relevant to the casualty forecast. In embodiments, the set of maritime assets includes one or more ships, and wherein the digital twin provides for visualization of a plurality of inspection points associated with one or more of the ships and maintenance histories associated with those inspection points relevant to the casualty forecast. In embodiments, the digital twin further provides for the visualization of the plurality of inspection points associated with one or more of the ships within a geofenced area relevant to the casualty forecast and maintenance histories associated with those inspection points.

[2181] In embodiments, the digital twin further provides for details of a ledger of activity associated with the visualization of the plurality of inspection points associated with one or more of the ships within a geofenced area relevant to the casualty forecast and maintenance histories associated with those inspection points.

[2182] In embodiments, an information technology system comprising: a value chain network management platform for identifying theft or misuse of a port infrastructure facility by correlating data between a set of data collectors for the physical item and a set of digital twins for at least one of the port infrastructure facility and a set of operators.

[2183] In embodiments, the set of digital twins of the port infrastructure facility includes one or more of the attributes in combination with one or more of the sets of recommendations of changes to attributes associated with the port infrastructure facility. In embodiments, the set of digital twins is configured to provide visualizations of a plurality of inspection points on the port infrastructure facility and maintenance histories associated with those inspection points. In embodiments, the set of digital twins is configured to provide details of a ledger of activity associated with the visualization of the plurality of inspection points on the port infrastructure facility within a geofenced area and maintenance histories associated with those inspection points. In embodiments, the set of digital twins is configured to at least partially represent at least a portion of the port infrastructure facility associated with an event investigation and to at least partially detail a timeline of the event investigation and associated with the port infrastructure facility. In embodiments, the set of digital twins is configured to at least partially represent at least a portion of the port infrastructure facility associated with a legal proceeding and to at least partially detail at least a portion of a timeline pertinent to the legal proceeding and associated with the port infrastructure facility.

[2184] In embodiments, the set of digital twins is configured to at least partially represent at least a portion of the port infrastructure facility associated with a casualty forecast and to at least partially detail at least a portion of a timeline pertinent to the casualty report and associated port infrastructure facility. In embodiments, the digital twin details the one or more physical items in

the port infrastructure facility for at least one operator that includes a view of expected states of at least a portion of the one or more physical items. In embodiments, the set of digital twins provides further visualization of at least one geofence that integrates representation of at least a portion of the port infrastructure facility with a representation of a maritime environment adjacent to the geofence.

[2185] In embodiments, an information technology system comprising: a value chain network management platform identifying theft or misuse of a shipyard facility by correlating data between a set of data collectors for the physical item and a set of digital twins for at least one of the shipyard facility and a set of operators. In embodiments, the set of digital twins for at least one of the shipyard facilities and a set of operators includes one or more of the attributes in combination with one or more of the sets of recommendations of changes to attributes associated with the shipyard facility. In embodiments, the set of digital twins is configured to provide visualizations of a plurality of inspection points on in the shipyard facility and maintenance histories associated with those inspection points. In embodiments, the set of digital twins is configured to provide details of a ledger of activity associated with the visualization of the plurality of inspection points on the shipyard facility within a geofenced area and maintenance histories associated with those inspection points. In embodiments, the set of digital twins is configured to at least partially represent at least a portion of the shipyard facility associated with an event investigation and to at least partially detail a timeline of the event investigation and associated with the port infrastructure facility.

[2186] In embodiments, the set of digital twins is configured to at least partially represent at least a portion of the shipyard facility associated with a legal proceeding and to at least partially detail at least a portion of a timeline pertinent to the legal proceeding and associated with the shipyard facility. In embodiments, the set of digital twins is configured to at least partially represent at least a portion of the shipyard facility associated with a casualty forecast and to at least partially detail at least a portion of a timeline pertinent to the casualty report and associated shipyard facility. In embodiments, the digital twin details the one or more physical items in the shipyard facility for at least one operator that includes a view of expected states of at least a portion of the one or more physical items. In embodiments, the set of digital twins provides further visualization of at least one geofence that integrates representation of at least a portion of the shipyard facility with a representation of a maritime environment adjacent to the geofence.

[2187] In embodiments, an information technology system comprising: a value chain network management platform for learning on a training set of maritime outcomes, parameters, and data collected from data sources to train an artificial intelligence system to determine a set of geofence parameters and represent at least one geofence in a digital twin that integrates representation of a

set of maritime entities with a representation of a maritime environment. In embodiments, the set of maritime entities is associated with a real-world shipyard, and wherein the digital twin is configured to represent the real-world shipyard and geofence parameters include a location within the real-world shipyard. In embodiments, the set of maritime entities is associated with a real-world maritime port, and wherein the digital twin is configured to represent the real-world maritime port and geofence parameters include a location within the real-world maritime port. In embodiments, the set of maritime entities is associated with one or more container ships, and wherein the digital twin is configured to represent the one or more container ships relative to the geofence parameters. In embodiments, the set of maritime entities is associated with one or more container barges, and wherein the digital twin is configured to represent the one or more barges relative to the geofence parameters. In embodiments, the set of maritime entities is associated with an event investigation and wherein the digital twin is configured to at least partially represent the set of maritime entities as it at least one of interacted during a timeline associated with the event investigation or is predicted to act based on a suggestion associated with the event investigation.

[2188] In embodiments, the set of maritime entities is associated with a legal proceeding and wherein the digital twin is configured to at least partially represent the set of maritime entities as it at least one of interacted during a timeline associated with the legal proceeding or is predicted to act based on a suggestion associated with the legal proceeding. In embodiments, the data collected by the value chain network management platform relates to a casualty report, wherein the digital twin of the set of maritime entities is configured to simulate possibilities of a loss relevant to the casualty report based on the data collected by the value chain network management platform.

[2189] In embodiments, the data collected by a value chain network management platform facilitates identifying theft or misuse of physical items contained on the set of maritime entities by correlating data between a set of data collectors for one or more physical items on the set of maritime entities and the digital twin detailing the one or more physical items associated with the set of maritime entities for the at least one of a port infrastructure facility and a set of operators. In embodiments, the set of maritime entities is a container ship that is moored to port infrastructure installed on or adjacent to land. In embodiments, data collected by a value chain network management platform is based on at least a ship having a forward speed relative to water and weather conditions and parameters associated with energy consumption of propulsion units on the ship.

[2190] In embodiments, further comprising an asset management application associated with the value chain network management platform and one or more maritime entities connected to a ship. In embodiments, the asset management application is associated with one or more ships connected to barges. In embodiments, the set of maritime entities includes one or more ships, and wherein

the digital twin provides for visualization of a navigation course of one or more of the ships. In embodiments, the set of maritime entities includes one or more ships, and wherein the digital twin provides for visualization of an engine performance of one or more of the ships. In embodiments, the set of maritime entities includes one or more ships, and wherein the digital twin provides for visualization of a hull integrity of one or more of the ships. In embodiments, the digital twin provides for visualization of a plurality of inspection points on the set of the maritime entities and maintenance histories associated with those inspection points. In embodiments, the digital twin further provides for the visualization of the plurality of inspection points on the set of the maritime entities within the geofenced parameters and maintenance histories associated with those inspection points. In embodiments, the digital twin further provides for details of a ledger of activity associated with the visualization of the plurality of inspection points on the maritime entities within the geofenced parameters and maintenance histories associated with those inspection points. In embodiments, the training set of maritime outcomes, parameters, and data collected from the data sources is related to a set of shipping activities.

[2191] In embodiments, an information technology system comprising: a value chain network management platform for learning on a training set of maritime outcomes, parameters, and data collected from data sources relating to a set of shipping activities to train an artificial intelligence system to determine a set of geofence parameters and represent at least one geofence in a digital twin that integrates representation of a set of maritime entities with a representation of a maritime environment. In embodiments, the set of maritime entities is associated with a real-world shipyard, and wherein the digital twin is configured to represent the real-world shipyard, its associated set of the shipping activities and geofence parameters include a location within the real-world shipyard.

[2192] In embodiments, the set of maritime entities is associated with a real-world maritime port, and wherein the digital twin is configured to represent the real-world maritime port, its associated set of the shipping activities and geofence parameters include a location within the real-world maritime port. In embodiments, the set of maritime entities is associated with one or more container ships, and wherein the digital twin is configured to represent the one or more container ships and its associated set of the shipping activities relative to the geofence parameters.

[2193] In embodiments, the set of maritime entities is associated with one or more container barges, and wherein the digital twin is configured to represent the one or more barges and its associated set of the shipping activities relative to the geofence parameters. In embodiments, the set of maritime entities is associated with an event investigation, and wherein the digital twin is configured to at least partially represent the set of maritime entities and its associated set of the shipping activities at least partially detailed on a timeline associated with the event investigation.

In embodiments, the set of maritime entities is associated with a legal proceeding and wherein the digital twin is configured to at least partially represent the set of maritime entities as it at least one of interacted during a timeline associated with the legal proceeding or is predicted to act based on a suggestion associated with the legal proceeding. In embodiments, the data collected by the value chain network management platform relates to a casualty report, wherein the digital twin of the set of maritime entities is configured to simulate possibilities of a loss relevant to the casualty report based on the data collected by the value chain network management platform. In embodiments, the data collected by a value chain network management platform facilitates identifying theft or misuse of physical items contained on the set of maritime entities by correlating data between a set of data collectors for one or more physical items on the set of maritime entities and the digital twin detailing the one or more physical items associated with the set of maritime entities for the at least one of a port infrastructure facility and a set of operators. In embodiments, the set of maritime entities is a container ship that is moored to port infrastructure installed on or adjacent to land. In embodiments, data collected by a value chain network management platform is based on at least a ship having a forward speed relative to water and weather conditions and parameters associated with energy consumption of propulsion units on the ship.

[2194] In embodiments, further comprising an asset management application associated with the value chain network management platform and one or more maritime entities connected to a ship. In embodiments, the asset management application is associated with one or more ships connected to barges. In embodiments, the set of maritime entities includes one or more ships, and wherein the digital twin provides for visualization of a navigation course of one or more of the ships.

[2195] In embodiments, the set of maritime entities includes one or more ships, and wherein the digital twin provides for visualization of an engine performance of one or more of the ships. In embodiments, the set of maritime entities includes one or more ships, and wherein the digital twin provides for visualization of a hull integrity of one or more of the ships. In embodiments, the digital twin provides for visualization of a plurality of inspection points on the set of the maritime entities and one of maintenance histories and the set of shipping activities associated with those inspection points. In embodiments, the digital twin further provides for the visualization of the plurality of inspection points on the set of the maritime entities within the geofenced parameters and one of maintenance histories and the set of shipping activities associated with those inspection points. In embodiments, the digital twin further provides for details of a ledger of activity associated with the visualization of the plurality of inspection points on the maritime entities within the geofenced parameters and one of maintenance histories and the set of shipping activities associated with those inspection points.

[2196] In embodiments, an information technology system comprising: a value chain network management platform generating a digital twin representing a real-world maritime port. In embodiments, the digital twin representing the real-world maritime port includes one or more container ships. In embodiments, the digital twin representing the real-world maritime port includes one or more barges. In embodiments, the digital twin representing the real-world maritime port includes one or more components of the port infrastructure installed on or adjacent to land.

[2197] In embodiments, the digital twin representing the real-world maritime port also includes a container ship moored to a component of the port infrastructure. In embodiments, the digital twin representing the real-world maritime port includes include one or more moored navigation units deployed on water. In embodiments, digital twin representing the real-world maritime port includes include one or more ships connected to barges. In embodiments, the digital twin representing the real-world maritime port includes a ship. In embodiments, the digital twin is configured to provide for visualization of a navigation course of the ship in a simulated maritime port based on the real-world maritime port. In embodiments, the digital twin is configured to provide for visualization of an engine performance of the ship including an emissions profile as the ship moves around the real-world maritime port. In embodiments, the digital twin is configured to provide for visualization of a hull of the ship as it moves through the real-world maritime port on a path having a water depth, wherein the digital twin is configured to further provide for visualization of a proximity of a portion of the hull to a portion of a seafloor in the real-word shipyard. In embodiments, the digital twin displays suggestions from an artificial intelligence system that generates a portion of a maintenance schedule to maintain the water depth through the real-world maritime port based on at least a combination of a portion of actual activity in the real-world maritime port and simulations provided by the digital twin of the real-world maritime port. In embodiments, the digital twin is configured to provide visualizations of a plurality of inspection points in the real-world maritime port and maintenance histories associated with those inspection points.

[2198] In embodiments, the digital twin is configured to provide for visualizations of the plurality of inspection points in the real-world maritime port and maintenance histories associated with those inspection points when within a geofenced area. In embodiments, the digital twin is configured to provide details of a ledger of activity associated with the visualization of the plurality of inspection points and maintenance histories associated with those inspection points within a geofenced of the real-world maritime port. In embodiments, the digital twin is configured to provide for further visualization for a first user of one of a navigation course of a ship and an engine performance of the ship within a first geofenced area of the real-world maritime port and for further visualization for a second user of one of the navigation course of the ship and the engine performance of the

ship within a second different geofenced area in the real-world maritime port and where transit between the first and second geofenced areas motivates a handoff of the ship between the first user and the second user as depicted by the digital twin representing the real-world maritime port including the ship.

[2199] In embodiments, an information technology system comprising: a value chain network management platform for generating a digital twin representing a real-world shipyard. In embodiments, the digital twin representing the real-world shipyard includes one or more container ships. In embodiments, the digital twin representing the real-world shipyard includes one or more barges. In embodiments, the digital twin representing the real-world shipyard includes one or more components of the port infrastructure installed on or adjacent to land.

[2200] In embodiments, the digital twin representing the real-world shipyard also includes a container ship moored to a component of the port infrastructure. In embodiments, the digital twin representing the real-world shipyard includes include one or more moored navigation units deployed on water. In embodiments, the digital twin representing the real-world shipyard includes include one or more ships connected to barges.

[2201] In embodiments, the digital twin representing the real-world shipyard includes a ship. In embodiments, the digital twin is configured to provide for visualization of a navigation course of the ship in a simulated shipyard based on the real-world shipyard. In embodiments, the digital twin is configured to provide for visualization of an engine performance of the ship including an emissions profile as the ship moves around the real-world shipyard. In embodiments, the digital twin is configured to provide for visualization of a hull of the ship as it moves through the real-world shipyard on a path having a water depth, wherein the digital twin is configured to further provide for visualization of a proximity of a portion of the hull to a portion of a seafloor in the real-word shipyard. In embodiments, the digital twin displays suggestions from an artificial intelligence system that generates a portion of a maintenance schedule to maintain the water depth through the real-world shipyard based on at least a combination of a portion of actual activity in the real-world shipyard and simulations provided by the digital twin of the real-world shipyard. In embodiments, the digital twin is configured to provide visualizations of a plurality of inspection points in the real-world shipyard and maintenance histories associated with those inspection points.

[2202] In embodiments, the digital twin is configured to provide for visualizations of the plurality of inspection points in the real-world shipyard and maintenance histories associated with those inspection points when within a geofenced area. In embodiments, the digital twin is configured to provide details of a ledger of activity associated with the visualization of the plurality of inspection points and maintenance histories associated with those inspection points within a geofenced of the real-world shipyard. In embodiments, the digital twin is configured to provide for further

visualization for a first user of one of a navigation course of a ship and an engine performance of the ship within a first geofenced area of the real-world shipyard and for further visualization for a second user of one of the navigation course of the ship and the engine performance of the ship within a second different geofenced area in the real-world shipyard and where transit between the first and second geofenced areas motivates a handoff of the ship between the first user and the second user as depicted by the digital twin representing the real-world shipyard including the ship.

[2203] In embodiments, an information technology system comprising: a set of intelligent systems for automatically populating a digital twin of a maritime value chain network entity based on data collected by a value chain network management platform. In embodiments, the maritime value chain network entity is associated with a real-world shipyard, and wherein the digital twin is configured to represent the real-world shipyard. In embodiments, the maritime value chain network entity is associated with a real-world maritime port, and wherein the digital twin is configured to represent the real-world maritime port. In embodiments, the maritime value chain network entity is associated with a container ship, and wherein the digital twin is configured to represent the container ship.

[2204] In embodiments, the maritime value chain network entity is associated with a barge, and wherein the digital twin is configured to represent the barge. In embodiments, the maritime value chain network entity is associated with port infrastructure, and wherein the digital twin is configured to represent one or more components of the port infrastructure. In embodiments, the maritime value chain network entity is associated with an event investigation and wherein the digital twin is configured to at least partially represent the maritime value chain network entity as it interacted during a timeline associated with the event investigation. In embodiments, the maritime value chain network entity is associated with a legal proceeding and wherein the digital twin is configured to at least partially represent the maritime value chain network entity. In embodiments, the data collected by a value chain network management platform relates to a casualty report, wherein the digital twin of the maritime value chain network entity is configured to simulate possibilities of a loss relevant to the casualty report based on the data collected by a value chain network management platform. In embodiments, the maritime value chain network entity is a port infrastructure facility, wherein the data collected by a value chain network management platform facilitates identifying theft or misuse of the port infrastructure facility by correlating data between a set of data collectors for one or more physical items in the port infrastructure facility and the digital twin detailing the one or more physical items of the port infrastructure facility for the at least one of the port infrastructure facility and the set of operators. In embodiments, the maritime value chain network entity is a container ship that is moored to port infrastructure installed on or adjacent to land. In embodiments, data collected by a value chain

network management platform is based on at least a container ship having a forward speed relative to water and weather conditions and parameters associated with energy consumption of propulsion units on the container ship.

[2205] In embodiments, further comprising an asset management application associated with the value chain network management platform and one or more maritime facilities connected to a container ship. In embodiments, the asset management application is associated with one or more ships connected to barges. In embodiments, the maritime value chain network entity is one or more ships, and wherein the digital twin provides for visualization of a navigation course of one or more of the ships. In embodiments, the maritime value chain network entity is one or more ships, and wherein the digital twin provides for visualization of an engine performance of one or more of the ships. In embodiments, the maritime value chain network entity is one or more ships, and wherein the digital twin provides for visualization of a hull integrity of one or more of the ships. In embodiments, the digital twin provides for visualization of a plurality of inspection points on the maritime value chain network entity and maintenance histories associated with those inspection points. In embodiments, the digital twin further provides for the visualization of the plurality of inspection points on the maritime value chain network entity within a geofenced area and maintenance histories associated with those inspection points. In embodiments, the digital twin further provides for details of a ledger of activity associated with the visualization of the plurality of inspection points on the maritime value chain network entity within a geofenced area and maintenance histories associated with those inspection points.

[2206] Thus, in one aspect, methods described above and combinations thereof may be embodied in computer executable code that, when executing on one or more computing devices, performs the steps thereof. In another aspect, the methods may be embodied in systems that perform the steps thereof and may be distributed across devices in a number of ways, or all of the functionality may be integrated into a dedicated, standalone device or other hardware. In another aspect, the means for performing the steps associated with the processes described above may include any of the hardware and/or software described above. All such permutations and combinations are intended to fall within the scope of the present disclosure.

[2207] While the disclosure has been disclosed in connection with the preferred embodiments shown and described in detail, various modifications and improvements thereon will become readily apparent to those skilled in the art. Accordingly, the spirit and scope of the present disclosure is not to be limited by the foregoing examples, but is to be understood in the broadest sense allowable by law.

[2208] The use of the terms "a" and "an" and "the" and similar referents in the context of describing the disclosure (especially in the context of the following claims) is to be construed to

cover both the singular and the plural, unless otherwise indicated herein or clearly contradicted by context. The terms "comprising," "with," "including," and "containing" are to be construed as open-ended terms (i.e., meaning "including, but not limited to,") unless otherwise noted. Recitations of ranges of values herein are merely intended to serve as a shorthand method of referring individually to each separate value falling within the range, unless otherwise indicated herein, and each separate value is incorporated into the specification as if it were individually recited herein. All methods described herein can be performed in any suitable order unless otherwise indicated herein or otherwise clearly contradicted by context. The use of any and all examples, or exemplary language (e.g., "such as") provided herein, is intended merely to better illuminate the disclosure and does not pose a limitation on the scope of the disclosure unless otherwise claimed. The term "set" may include a set with a single member. No language in the specification should be construed as indicating any non-claimed element as essential to the practice of the disclosure.

[2209] While the foregoing written description enables one skilled to make and use what is considered presently to be the best mode thereof, those skilled in the art will understand and appreciate the existence of variations, combinations, and equivalents of the specific embodiment, method, and examples herein. The disclosure should therefore not be limited by the above described embodiment, method, and examples, but by all embodiments and methods within the scope and spirit of the disclosure.

[2210] All documents referenced herein are hereby incorporated by reference as if fully set forth herein.

CLAIMS:

1. An information technology system, comprising:

a cloud-based management platform with a micro-services architecture, the platform having:

a set of interfaces that are configured to access and configure features of the platform;

a set of network connectivity facilities that are configured to direct a set of value chain network entities to connect to the features of the platform;

a set of adaptive intelligence facilities that are configured to automate a set of capabilities of the platform related to at least one of the set of value chain network entities or the features of the platform, wherein the set of adaptive intelligence facilities includes:

a set of opportunity miners that are configured to identify opportunities for improving interactions among the set of value chain network entities, and

a robotic process automation (RPA) system that is configured to automate a set of interactions among the set of value chain network entities;

a set of data storage facilities that are configured to store data collected and handled by the platform, wherein the data is related to the at least one of the set of value chain network entities or the features of the platform; and

a set of monitoring facilities that are configured to monitor the set of value chain network entities;

wherein the platform is configured to host a set of applications for directing an enterprise to manage the set of value chain network entities from a point of origin of a product of the enterprise to a point of customer use, and

wherein the set of opportunity miners interacts with the set of monitoring facilities and the set of data storage facilities to:

(i) monitor for new data sources to identify an improvement opportunity for a particular interaction of the set of value chain network entities, and

(ii) search for training data sets related to the particular interaction for training the RPA system such that the RPA system is configured to automate the particular interaction by training a robotic system to perform the particular interaction.

2. The system of claim 1, wherein the set of interfaces includes at least one of a demand management interface and a supply chain management interface.

3. The system of claim 1, wherein the set of network connectivity facilities includes at least one of:

- a 5G network system deployed in a supply chain infrastructure facility operated by the enterprise.

- an Internet of Things system deployed in a supply chain infrastructure facility operated by the enterprise,

- a cognitive networking system deployed in a supply chain infrastructure facility operated by the enterprise, and

- a peer- to-peer network system deployed in a supply chain infrastructure facility operated by the enterprise.

4. The system of claim 1, wherein the set of adaptive intelligence facilities includes at least one of:

- an edge intelligence system deployed in a supply chain infrastructure facility operated by the enterprise,

- a self configuring data collection system deployed in a supply chain infrastructure facility operated by the enterprise,

- a digital twin system representing attributes of at least one value chain network entity of the value chain network entities controlled by the enterprise, and

- a smart contract system that is configured to automate a set of interactions among the value chain network entities.

5. The system of claim 1, wherein the set of data storage facilities uses at least one of:

- a distributed data architecture, and

- a graph database representing a set of hierarchical relationships of the value chain network entities.

6. The system of claim 1, wherein the set of data storage facilities uses a blockchain.

7. The system of claim 1, wherein the set of data storage facilities uses a distributed ledger.

8. The system of claim 1, wherein the set of monitoring facilities includes at least one of:

- an Internet of Things monitoring system, and

- a sensor system deployed in an infrastructure facility operated by the enterprise.

9. The system of claim 1, wherein the set of applications includes at least one of:

- a set of applications of at least two types from among a set of supply chain management applications, demand management applications, intelligent product applications, and enterprise resource management applications, and

- an asset management application.

10. The system of claim 1, wherein the value chain network entities are selected from the group consisting of products, suppliers, producers, manufacturers, retailers, businesses, owners, operators, operating facilities, customers, consumers, workers, mobile devices, wearable devices, distributors, resellers, supply chain infrastructure facilities, supply chain processes, logistics processes, reverse logistics processes, demand prediction processes, demand management processes, demand aggregation processes, machines, ships, barges, warehouses, maritime ports, airports, airways, waterways, roadways, railways, bridges, tunnels, online retailers, ecommerce sites, demand factors, supply factors, delivery systems, floating assets, points of origin, points of destination, points of storage, points of use, networks, information technology systems, software platforms, distribution centers, fulfillment centers, containers, container handling facilities, customs, export control, border control, drones, robots, autonomous vehicles, hauling facilities, drones/robots/AVs, waterways, and port infrastructure facilities.

11. The system of claim 1, wherein the platform manages a set of demand factors, a set of supply factors, and a set of supply chain infrastructure facilities.

12. The system of claim 11, wherein the supply factors are factors selected from the group consisting of Component availability, material availability, component location, material location, component pricing, material pricing, taxation, tariff, impost, duty, import regulation, export regulation, border control, trade regulation, customs, navigation, traffic, congestion, vehicle capacity, ship capacity, container capacity, package capacity, vehicle availability, ship availability, container availability, package availability, vehicle location, ship location, container location, port location, port availability, port capacity, storage availability, storage capacity, warehouse availability, warehouse capacity, fulfillment center location, fulfillment center availability, fulfillment center capacity, asset owner identity, system compatibility, worker availability, worker competency, worker location, goods pricing, fuel pricing, energy pricing, route availability, route distance, route cost, and route safety factors.

13. The system of claim 11, wherein the demand factors are factors selected from the group consisting of product availability, product pricing, delivery timing, need for refill, need for

replacement, manufacturer recall, need for upgrade, need for maintenance, need for update, need for repair, need for consumable, taste, preference, inferred need, inferred want, group demand, individual demand, family demand, business demand, need for workflow, need for process, need for procedure, need for treatment, need for improvement, need for diagnosis, compatibility to system, compatibility to product, compatibility to style, compatibility to brand, demographic, psychographic, geolocation, indoor location, destination, route, home location, visit location, workplace location, business location, personality, mood, emotion, customer behavior, business type, business activity, personal activity, wealth, income, purchasing history, shopping history, search history, engagement history, clickstream history, website history, online navigation history, group behavior, family behavior, family membership, customer identity, group identity, business identity, customer profile, business profile, group profile, family profile, declared interest, and inferred interest factors.

14. The system of claim 11, wherein the supply chain infrastructure facilities are facilities selected from the group consisting of ship, container ship, boat, barge, maritime port, crane, container, container handling, shipyard, maritime dock, warehouse, distribution, fulfillment, fueling, refueling, nuclear refueling, waste removal, food supply, beverage supply, drone, robot, autonomous vehicle, aircraft, automotive, truck, train, lift, forklift, hauling facilities, conveyor, loading dock, waterway, bridge, tunnel, airport, depot, vehicle station, train station, weigh station, inspection, roadway, railway, highway, customs house, and border control facilities.

15. The system of claim 1, wherein the set of applications involves a set selected from the group consisting of supply chain, asset management, risk management, inventory management, demand management, demand prediction, demand aggregation, pricing, positioning, placement, promotion, blockchain, smart contract, infrastructure management, facility management, analytics, finance, trading, tax, regulatory, identity management, commerce, ecommerce, payments, security, safety, vendor management, process management, compatibility testing, compatibility management, infrastructure testing, incident management, predictive maintenance, logistics, monitoring, remote control, automation, self-configuration, self-healing, self-organization, logistics, reverse logistics, waste reduction, augmented reality, virtual reality, mixed reality, demand customer profiling, entity profiling, enterprise profiling, worker profiling, workforce profiling, component supply policy management, product design, product configuration, product updating, product maintenance, product support, product

testing, warehousing, distribution, fulfillment, kit configuration, kit deployment, kit support, kit updating, kit maintenance, kit modification, kit management, shipping fleet management, vehicle fleet management, workforce management, maritime fleet management, navigation, routing, shipping management, opportunity matching, search, advertisement, entity discovery, entity search, distribution, delivery, and enterprise resource planning applications.
