WHAT IS CLAIMED IS:

1. A system for use with a subterranean well, the system comprising: at least one check valve which prevents outward flow through a wall of a tubular string in the well, the wall surrounding a longitudinally extending flow passage of the tubular string, and wherein the check valve comprises a ball or poppet which sealingly engages a seat, wherein the multiple check valves are configured in series, wherein the seats and balls or poppets are in a port through the wall.

2. The system of claim 1, wherein the seat encircles a port which provides fluid communication between the flow passage and an exterior of the tubular string.

3. The system of claim 1, wherein the at least one check valve comprises multiple check valves.

4. The system of claim 3, wherein the multiple check valves prevent outward flow through a same port.

5. The system of claim 4, further comprising a sleeve which is displaceable to a position wherein the sleeve blocks flow through the port.

6. The system of claim 3, wherein the multiple check valves comprise multiple poppets or balls having diameters different from each other.

7. The system of claim 3, wherein the multiple check valves comprise multiple seats having diameters different from each other.

8. A system for use with a subterranean well, the system comprising: multiple redundant check valves which prevent outward flow through a wall of a tubular string in the well, the wall surrounding a longitudinally extending flow passage of the tubular string, wherein the multiple redundant check valves are configured in series, wherein the check valves are in a port through the wall.

9. The system of claim 8, wherein the multiple redundant check valves prevent outward flow through a same port.

10. The system of claim 8, wherein the multiple redundant check valves comprise multiple balls having diameters different from each other.

11. The system of claim 8, wherein the multiple redundant check valves comprise multiple poppets having diameters different from each other.

12. The system of claim 8, wherein the multiple redundant check valves comprise multiple seats having diameters different from each other.

13. The system of claim 8, wherein each of the check valves comprises a ball or poppet which sealingly engages a seat.

14. The system of claim 13, wherein the seat encircles a port which provides fluid communication between the flow passage and an exterior of the tubular string.

15. The system of claim 14, further comprising a sleeve which is displaceable to a position wherein the sleeve blocks flow through the port.

16. A well tool for interconnection in a tubular string for use in a subterranean well, the tubular string including a longitudinally extending flow passage and a wall which surrounds the flow passage, the well tool comprising: multiple redundant check valves which prevent flow in a first direction through the wall, and which permit flow in a second direction opposite to the first direction through the wall, and wherein each of the multiple redundant check valves comprises a ball or poppet which sealingly engages a seat, wherein the multiple redundant check valves are configured in series, wherein the seats and balls or poppets are in a port through the wall.

17. The well tool of claim 16, wherein each seat encircles a port which provides fluid communication between the flow passage and an exterior of the tubular string.

18. The well tool of claim 16, wherein the multiple redundant check valves prevent flow through a same port.

19. The well tool of claim 18, further comprising a sleeve which is displaceable to a position wherein the sleeve blocks flow through the port.

20. The well tool of claim 16, wherein the balls or poppets have diameters different from each other.

21. The well tool of claim 16, wherein the seats have diameters different from each other.

22. The well tool of claim 16, wherein the multiple redundant check valves prevent outward flow through the wall.

23. The system of claim 1, wherein the port through the wall is angled obliquely relative to the wall.

24. The system of claim 8, wherein the port through the wall is angled obliquely relative to the wall.

25. The well tool of claim 16, wherein the port through the wall is angled obliquely relative to the wall.

CLAIMS

1. A system for use with a subterranean well, the system comprising: multiple check valves which prevents prevent outward flow through a wall of a tubular string in the well, the wall surrounding a longitudinally extending flow passage of the tubular string, and wherein each check valve comprises a ball or poppet which sealingly engages a respective seat, wherein the multiple check valves are configured in series, wherein the seats and balls or poppets are in a port through the wall.

2. The system of claim 1, wherein each seat encircles a port which provides fluid communication between the flow passage and an exterior of the tubular string.

3. The system of claim 1, wherein the multiple check valves prevent outward flow through a same port.

4. The system of claim 3, further comprising a sleeve which is displaceable to a position wherein the sleeve blocks flow through the port.

5. The system of claim 1, wherein the multiple check valves comprise multiple poppets or balls having diameters different from each other.

6. The system of claim 1, wherein the multiple check valves comprise multiple seats having diameters different from each other.

7. A system for use with a subterranean well, the system comprising: multiple redundant check valves which prevent outward flow through a wall of a tubular string in the well, the wall surrounding a longitudinally extending flow passage of the tubular string, wherein the multiple redundant check valves are configured in series, wherein the check valves are in a port through the wall.

8. The system of claim 7, wherein the multiple redundant check valves prevent outward flow through a same port.

9. The system of claim 7, wherein the multiple redundant check valves comprise multiple balls having diameters different from each other.

10. The system of claim 7, wherein the multiple redundant check valves comprise multiple poppets having diameters different from each other.

11. The system of claim 7, wherein the multiple redundant check valves comprise multiple seats having diameters different from each other.

12. The system of claim 7, wherein each of the check valves comprises a ball or poppet which sealingly engages a respective seat.

13. The system of claim 12, wherein each seat encircles a port which provides fluid communication between the flow passage and an exterior of the tubular string.

14. The system of claim 13, further comprising a sleeve which is displaceable to a position wherein the sleeve blocks flow through the port.

15. A well tool for interconnection in a tubular string for use in a subterranean well, the tubular string including a longitudinally extending flow passage and a wall which surrounds the flow passage, the well tool comprising: multiple redundant check valves which prevent flow in a first direction through the wall, and which permit flow in a second direction opposite to the first direction through the wall, and wherein each of the multiple redundant check valves comprises a ball or poppet which sealingly

engages a respective seat, wherein the multiple redundant check valves are configured in series, wherein the seats and balls or poppets are in a port through the wall.

16. The well tool of claim 15, wherein each seat encircles a port which provides fluid communication between the flow passage and an exterior of the tubular string.

17. The well tool of claim 15, wherein the multiple redundant check valves prevent flow through a same port.

18. The well tool of claim 17, further comprising a sleeve which is displaceable to a position wherein the sleeve blocks flow through the port.

19. The well tool of claim 15, wherein the balls or poppets have diameters different from each other.

20. The well tool of claim 15, wherein the seats have diameters different from each other.

21. The well tool of claim 15, wherein the multiple redundant check valves prevent outward flow through the wall.

22. The system of claim 1, wherein the port through the wall is angled obliquely relative to the wall.

23. The system of claim 7, wherein the port through the wall is angled obliquely relative to the wall.

24. The well tool of claim 15, wherein the port through the wall is angled obliquely relative to the wall.
