ABSTRACT

FRAUD PREVENTION DEVICE AND FRAUD PREVENTION UNIT

A fraud prevention device includes a near field communication portion, a fraud determination portion, and a travel determination portion. The near field communication portion performs a near field communication with a wireless tag. The wireless tag is used in a vehicle and transmits an identification code. The fraud determination portion determines whether there is an unauthorized change of a target device by verifying the received identification code from the wireless tag. The target device is constituted by a device to which the wireless tag is fixed or a device including the fraud prevention device. The travel determination portion determines whether the vehicle is traveling. The near field communication portion causes the wireless tag to transmit the identification code by requesting the wireless tag. The near field communication portion does not cause the wireless tag to transmit the identification code until the travel determination portion determines that the vehicle is traveling.
