CLAIMS

1. A display information management system comprising:

a first terminal device including,

first specific basic software included in an Operation System for running an operation including an abstraction of hardware of a computer to operate an application software on the computer,

first specific information displaying software being a software for displaying specific information for creating presentation screens operable with the first specific basic software, and

a database that stores various types of information used with the creation of the presentation screens;

a second terminal device including,

second specific information displaying software operable with a second specific basis software different from the first specific basis software; and

a management device communicably connected to the first and second terminal devices; wherein

the first terminal device:

associates, when the first specific information displaying software creates presentation screens, information of the database and the presentation screens, and creates presentation information in a page unit using the first specific information displaying software in association with the database, and creates heterogeneous presentation information operable with the second specific basis software in a page unit from the presentation information in a page unit using heterogeneous information displaying software data creating unit, the presentation information in a page unit and the heterogeneous presentation information in a page unit having the same content , and

transmits the presentation information in a page unit and the heterogeneous presentation information in a page unit to the management device;

wherein the management device:

acquires the database information from the first terminal device, determines appropriateness of change when a change is made to the acquired database information, updates the database when determining that the change is appropriate, and notifies the first

terminal device that the change is inappropriate when determining that the change is inappropriate, and

selects the heterogeneous presentation information in a page unit operable with the second specific basic software information of the second terminal device being a destination to provide the heterogeneous presentation information in a page unit, and provides to the second terminal device.

2. The display information management system according to claim 1, wherein when the management device changes the own database, the management device also provides information related to the change to the second terminal device.
