ABSTRACT

A method ~~and apparatus~~ for transmitting assistance information~~, and a readable storage medium. The method comprises~~ is performed by a network device, and includes: sending first indication information to a user equipment, wherein the first indication information ~~being used for instructing~~is configured to instruct the user equipment to report the assistance information ~~at~~of a target moment, ~~wherein~~and the target moment ~~comprises~~includes at least one of ~~the following moments:~~ a current moment ~~and~~or a future moment. ~~A network device sends the first indication information to the user equipment to instruct the user equipment to report the assistance information at the target moment, such that the user equipment correspondingly reports the assistance information at the target moment according to the received first indication information. Thus, the network device controls the reporting of the user equipment, and the network device instructs the user equipment to report only when requiring to use the assistance information, such that the reporting process of the user equipment is more reasonable and optimized, and the problems that the power consumption of the user equipment is increased due to frequent reporting of the user equipment and the network equipment frequently performs unnecessary reconfiguration cannot occur.~~
