Abstract

A reinforcing plate (50) is mounted on the bottom plate (33) of a box body (31) of an electrical component box (30). A plurality of risers (51, 52, 53) are formed by cutting a side edge of the reinforcing plate (50) into some pieces and bending the pieces upward. A safety cover (38) for opening and closing an opening of the box body (31) is fitted between the risers (51, 52, 53) and thereby held by the reinforcing plate (50).
