ABSTRACT

DEVICE FOR TRANSPORTING GRAFT

An object of the present invention is to provide a device which can efficiently establish a liquid-tight state with a simple operation.

The present invention relates to a device to be used in a state of being detachably attached to a container for storing a graft, the device including: a lid member for sealing the container; and an annular member for forming a first space by being interposed between the lid member and the container, wherein a second space is formed between the lid member and an inside surface of the container.
