

ABSTRACT

System for handling of refunding of value-added tax to a consumer who has purchased goods in another country than his country of residence.

Comprising a central database (5) and first terminals, which are placed in shops (1, 2, 3) that are connected to the system.

The first terminals are provided with equipment for entering purchase data. The system is arranged to create electronic cheques on the basis of said data.

The system comprises information carriers intended to be carried by the person in question. Personal details, such as name, address and passport number, are stored on the information carrier. An identifying reference is stored on each information carrier and the system comprises computer programs for linking said reference and electronic cheques for the person's purchases, and for storing the cheques together with their references in the database.

The system comprises second terminals, which are provided with equipment for gathering said references from the information carriers of consumers. The second terminals are arranged to gather electronic cheques belonging to the references from the database, whereafter a consumer's purchase data can be presented together with personal details for customs inspection.
