ABSTRACT

The present disclosure provides a data storage method and apparatus, a device, a storage medium, and a program product. The method includes: receiving a data storage request, where the data storage request is used to request storing first data in a disk; when a data size of the first data is greater than or equal to a preset threshold, creating a first page corresponding to the first data; and storing the first data in the first page, and mounting the first page in an index tree corresponding to the disk. Resource overhead of data storage is reduced.
