Abstract

Purpose

To offer a linear motor with an assembled core without bending or twisting.

Solution

A bundling member (30) with a U-shaped cross section is installed such that it covers the sides and the back surface of laminated core plates (4), and the laminated core plates (4) and the bundling member (30) are connected in an integrated manner by screwing a nut (32) on bolt (31) that passes through the bundling member (30) and the core plates (4) to form an assembled core (5).
