

METHOD AND APPARATUS FOR DISPLAYING INFORMATION ON A HUMAN MACHINE INTERFACE

5 **ABSTRACT**

The invention relates to a method for displaying information of a monitored device on a Human Machine Interface (HMI) including the steps of defining a device area to represent the monitored device, defining a device area property, said property having
10 a variation, allowing a message of a message type from the monitored device to be received, defining a category for each message, defining a category area for each category, displaying the received message in the category, defining and allowing a message area for each message, identifying the type of received message, whereby
15 the message type of a pre-determined highest property from the monitored device is known from the device area property variation.
