### FIELD OF THE INVENTION

The field of the invention pertains to compounds of Formula (00A), and subformulas thereof, which are inhibitors of a Janus kinase, such as JAK1, as well as compositions containing these compounds, and methods of use including, but not limited to, diagnosis or treatment of patients suffering from a condition responsive to the inhibition of a JAK kinase.

### BACKGROUND OF INVENTION

Cytokine pathways mediate a broad range of biological functions, including many aspects of inflammation and immunity. Janus kinases (JAK), including JAK1, JAK2, JAK3 and TYK2, are cytoplasmic protein kinases that associate with type I and type II cytokine receptors and regulate cytokine signal transduction. Cytokine engagement with cognate receptors triggers activation of receptor associated JAKs and this leads to JAK-mediated tyrosine phosphorylation of signal transducer and activator of transcription (STAT) proteins and ultimately transcriptional activation of specific gene sets (Schindler et al., 2007, J. Biol. Chem. 282: 20059-63). JAK1, JAK2 and TYK2 exhibit broad patterns of gene expression, while JAK3 expression is limited to leukocytes. Cytokine receptors are typically functional as heterodimers, and as a result, more than one type of JAK kinase is usually associated with cytokine receptor complexes. The specific JAKs associated with different cytokine receptor complexes have been determined in many

cases through genetic studies and corroborated by other experimental evidence. Exemplary therapeutic benefits of the inhibition of JAK enzymes are discussed, for example, in International Application No. WO 2013/014567.

JAK1 was initially identified in a screen for novel kinases (Wilks A.F., 1989, 5 Proc. Natl. Acad. Sci. U.S.A. 86:1603-1607). Genetic and biochemical studies have shown that JAK1 is functionally and physically associated with the type I interferon (e.g., IFN $\alpha$ ), type II interferon (e.g., IFN $\gamma$ ), and IL-2 and IL-6 cytokine receptor complexes (Kisseleva et al., 2002, Gene 285:1-24; Levy et al., 2005, Nat. Rev. Mol. Cell Biol. 3:651-662; O'Shea et al., 2002, Cell, 109 (suppl.): S121-S131). JAK1 knockout 10 mice die perinatally due to defects in LIF receptor signaling (Kisseleva et al., 2002, Gene 285:1-24; O'Shea et al., 2002, Cell, 109 (suppl.): S121-S131). Characterization of tissues derived from JAK1 knockout mice demonstrated critical roles for this kinase in the IFN, IL-10, IL-2/IL-4 and IL-6 pathways. A humanized monoclonal antibody targeting the IL-6 pathway (Tocilizumab) was approved by the European Commission for the treatment of 15 moderate-to-severe rheumatoid arthritis (Scheinecker et al., 2009, Nat. Rev. Drug Discov. 8:273-274).

CD4 T cells play an important role in asthma pathogenesis through the production of TH2 cytokines within the lung, including IL-4, IL-9 and IL-13 (Cohn et al., 2004, Annu. Rev. Immunol. 22:789-815). IL-4 and IL-13 induce increased mucus production, 20 recruitment of eosinophils to the lung, and increased production of IgE (Kasaian et al., 2008, Biochem. Pharmacol. 76(2): 147-155). IL-9 leads to mast cell activation, which exacerbates the asthma symptoms (Kearley et al., 2011, Am. J. Resp. Crit. Care Med., 183(7): 865-875). The IL-4R $\alpha$  chain activates JAK1 and binds to either IL-4 or IL-13 when combined with the common gamma chain or the IL-13R $\alpha$ 1 chain respectively 25 (Pernis et al., 2002, J. Clin. Invest. 109(10):1279-1283). The common gamma chain can also combine with IL-9R $\alpha$  to bind to IL-9, and IL-9R $\alpha$  activates JAK1 as well (Demoulin et al., 1996, Mol. Cell Biol. 16(9):4710-4716). While the common gamma chain activates JAK3, it has been shown that JAK1 is dominant over JAK3, and inhibition of JAK1 is sufficient to inactivate signaling through the common gamma chain 30 despite JAK3 activity (Haan et al., 2011, Chem. Biol. 18(3):314-323). Inhibition of IL-4, IL-13 and IL-9 signaling by blocking the JAK/STAT signaling pathway can alleviate

asthmatic symptoms in pre-clinical lung inflammation models (Mathew et al., 2001, J. Exp. Med. 193(9): 1087-1096; Kudlacz et. al., 2008, Eur. J. Pharmacol. 582(1-3): 154-161).

Biochemical and genetic studies have shown an association between JAK2 and  
5 single-chain (e.g., EPO), IL-3 and interferon gamma cytokine receptor families  
(Kisseleva et al., 2002, Gene 285:1-24; Levy et al., 2005, Nat. Rev. Mol. Cell Biol.  
3:651-662; O'Shea et al., 2002, Cell, 109 (suppl.): S121-S131). Consistent with this,  
JAK2 knockout mice die of anemia (O'Shea et al., 2002, Cell, 109 (suppl.): S121-S131).  
Kinase activating mutations in JAK2 (e.g., JAK2 V617F) are associated with  
10 myeloproliferative disorders in humans.

JAK3 associates exclusively with the gamma common cytokine receptor chain,  
which is present in the IL-2, IL-4, IL-7, IL-9, IL-15 and IL-21 cytokine receptor  
complexes. JAK3 is critical for lymphoid cell development and proliferation and  
mutations in JAK3 result in severe combined immunodeficiency (SCID) (O'Shea et al.,  
15 2002, Cell, 109 (suppl.): S121-S131). Based on its role in regulating lymphocytes, JAK3  
and JAK3-mediated pathways have been targeted for immunosuppressive indications  
(e.g., transplantation rejection and rheumatoid arthritis) (Baslund et al., 2005, Arthritis &  
Rheumatism 52:2686-2692; Changelian et al., 2003, Science 302: 875-878).

TYK2 associates with the type I interferon (e.g., IFNalpha), IL-6, IL-10, IL-12  
20 and IL-23 cytokine receptor complexes (Kisseleva et al., 2002, Gene 285:1-24; Watford,  
W.T. & O'Shea, J.J., 2006, Immunity 25:695-697). Consistent with this, primary cells  
derived from a TYK2 deficient human are defective in type I interferon, IL-6, IL-10, IL-  
12 and IL-23 signaling. A fully human monoclonal antibody targeting the shared p40  
subunit of the IL-12 and IL-23 cytokines (Ustekinumab) was recently approved by the  
25 European Commission for the treatment of moderate-to-severe plaque psoriasis (Krueger  
et al., 2007, N. Engl. J. Med. 356:580-92; Reich et al., 2009, Nat. Rev. Drug Discov.  
8:355-356). In addition, an antibody targeting the IL-12 and IL-23 pathways underwent  
clinical trials for treating Crohn's Disease (Mannon et al., 2004, N. Engl. J. Med.  
351:2069-79).

30 There exists a need in the art for additional or alternative treatments of conditions  
mediated by JAK kinases, such as those described above.

The term "oxo" refers to =O or (=O)<sub>2</sub>.

As used herein a wavy line “~” that intersects a bond in a chemical structure indicate the point of attachment of the atom to which the wavy bond is connected in the chemical structure to the remainder of a molecule, or to the remainder of a fragment of a molecule. In some embodiments, an arrow together with an asterisk is used in the manner of a wavy line to indicate a point of attachment.

In certain embodiments, divalent groups are described generically without specific bonding configurations. It is understood that the generic description is meant to include both bonding configurations, unless specified otherwise. For example, in the group  $R^1-R^2-R^3$ , if the group  $R^2$  is described as  $-CH_2C(O)-$ , then it is understood that this group can be bonded both as  $R^1-CH_2C(O)-R^3$ , and as  $R^1-C(O)CH_2-R^3$ , unless specified otherwise.

A "sterile" formulation is aseptic or free from all living microorganisms and their spores.

"Stereoisomers" refer to compounds that have identical chemical constitution, but differ with regard to the arrangement of the atoms or groups in space. Stereoisomers include diastereomers, enantiomers, conformers and the like.

“Chiral” refers to molecules which have the property of non-superimposability of the mirror image partner, while the term “achiral” refers to molecules which are superimposable on their mirror image partner.

“Diastereomer” refers to a stereoisomer with two or more centers of chirality and  
5 whose molecules are not mirror images of one another. Diastereomers have different physical properties, e.g., melting points, boiling points, spectral properties or biological activities. Mixtures of diastereomers may separate under high resolution analytical procedures such as electrophoresis and chromatography such as HPLC.

“Enantiomers” refer to two stereoisomers of a compound which are non-  
10 superimposable mirror images of one another.

Stereochemical definitions and conventions used herein generally follow S. P. Parker, Ed., McGraw-Hill Dictionary of Chemical Terms (1984) McGraw-Hill Book Company, New York; and Eliel, E. and Wilen, S., “Stereochemistry of Organic Compounds”, John Wiley & Sons, Inc., New York, 1994. Many organic compounds  
15 exist in optically active forms, i.e., they have the ability to rotate the plane of plane-polarized light. In describing an optically active compound, the prefixes D and L, or *R* and *S*, are used to denote the absolute configuration of the molecule about its chiral center(s). The prefixes d and l or (+) and (-) are employed to designate the sign of rotation of plane-polarized light by the compound, with (-) or l meaning that the  
20 compound is levorotatory. A compound prefixed with (+) or d is dextrorotatory. For a given chemical structure, these stereoisomers are identical except that they are mirror images of one another. A specific stereoisomer may also be referred to as an enantiomer, and a mixture of such isomers is often called an enantiomeric mixture. A 50:50 mixture of enantiomers is referred to as a racemic mixture or a racemate, which may occur where  
25 there has been no stereoselection or stereospecificity in a chemical reaction or process. The terms “racemic mixture” and “racemate” refer to an equimolar mixture of two enantiomeric species, devoid of optical activity.

The term “tautomer” or “tautomeric form” refers to structural isomers of different energies which are interconvertible via a low energy barrier. For example, proton  
30 tautomers (also known as prototropic tautomers) include interconversions via migration

of a proton, such as keto-enol and imine-enamine isomerizations. Valence tautomers include interconversions by reorganization of some of the bonding electrons.

Certain compounds of the present invention can exist in unsolvated forms as well as solvated forms, including hydrated forms. A "solvate" refers to an association or  
5 complex of one or more solvent molecules and a compound of the present invention. Examples of solvents that form solvates include water, isopropanol, ethanol, methanol, DMSO, ethyl acetate, acetic acid, and ethanolamine. Certain compounds of the present invention can exist in multiple crystalline or amorphous forms. In general, all physical forms are intended to be within the scope of the present invention. The term "hydrate"  
10 refers to the complex where the solvent molecule is water.

A "metabolite" refers to a product produced through metabolism in the body of a specified compound or salt thereof. Such products can result, for example, from the oxidation, reduction, hydrolysis, amidation, deamidation, esterification, deesterification, enzymatic cleavage, and the like, of the administered compound.

15 Metabolite products typically are identified by preparing a radiolabelled (e.g.,  $^{14}\text{C}$  or  $^3\text{H}$ ) isotope of a compound of the invention, administering it in a detectable dose (e.g., greater than about 0.5 mg/kg) to an animal such as rat, mouse, guinea pig, monkey, or to a human, allowing sufficient time for metabolism to occur (typically about 30 seconds to 30 hours) and isolating its conversion products from the urine, blood or other biological  
20 samples. These products are easily isolated since they are labeled (others are isolated by the use of antibodies capable of binding epitopes surviving in the metabolite). The metabolite structures are determined in conventional fashion, e.g., by MS, LC/MS or NMR analysis. In general, analysis of metabolites is done in the same way as conventional drug metabolism studies well known to those skilled in the art. The  
25 metabolite products, so long as they are not otherwise found in vivo, are useful in diagnostic assays for therapeutic dosing of the compounds of the invention.

"Amino-protecting group" as used herein refers to a derivative of the groups commonly employed to block or protect an amino group while reactions are carried out on other functional groups on the compound. Examples of such protecting groups

10 give the unprotected carboxy-group. Examples of carboxy protecting groups include, ester groups and heterocyclyl groups. Ester derivatives of the carboxylic acid group may be employed to block or protect the carboxylic acid group while reactions are carried out on other functional groups on the compound. Examples of such ester groups include substituted arylalkyl, including substituted benzyls, such as 4-nitrobenzyl, 4-

25 these groups are found in T. W. Greene and P. G. M. Wuts, "Protecting Groups in Organic Synthesis, 3<sup>rd</sup> ed., John Wiley & Sons, Inc., 1999. The term "protected carboxy" refers to a carboxy group substituted with one of the above carboxy-protecting groups.

"Hydroxy-protecting group" as used herein refers to a derivative of the hydroxy group commonly employed to block or protect the hydroxy group while reactions are  
30 carried out on other functional groups on the compound. Examples of such protecting groups include tetrahydropyranyloxy, benzoyl, acetoxy, carbamoyloxy, benzyl, and

silylethers (e.g., TBS, TBDPS) groups. Further examples of these groups are found in T. W. Greene and P. G. M. Wuts, "Protecting Groups in Organic Synthesis, 3<sup>rd</sup> ed., John Wiley & Sons, Inc., 1999. The term "protected hydroxy" refers to a hydroxy group substituted with one of the above hydroxy-protecting groups.

“Therapeutically effective amount” means an amount of a compound of the present invention, such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468, that (i) treats or prevents the particular disease, condition or disorder, or (ii) attenuates, ameliorates or eliminates one or more symptoms of the particular disease, condition, or disorder, and optionally (iii) prevents or delays the onset of one or more symptoms of the particular disease, condition or disorder described herein. In some embodiments, the therapeutically effective amount is an amount sufficient to decrease or alleviate the symptoms of an autoimmune or inflammatory disease (e.g., asthma). In some embodiments, a therapeutically effective amount is an amount of a chemical entity described herein sufficient to significantly decrease the activity or number of B-cells. In the case of cancer, the therapeutically effective amount of the drug may reduce the number of cancer cells; reduce the tumor size; inhibit (i.e., slow to some extent and preferably stop) cancer cell infiltration into peripheral organs; inhibit (i.e., slow to some extent and preferably stop) tumor metastasis; inhibit, to some extent, tumor growth; or relieve to some extent one or more of the symptoms associated with the cancer. To the extent the drug may prevent growth or kill existing cancer cells, it may be cytostatic or cytotoxic. For cancer therapy, efficacy can, for example, be measured by assessing the time to disease progression (TTP) or determining the response rate (RR).

“Treatment” (and variations such as “treat” or “treating”) refers to clinical intervention in an attempt to alter the natural course of the individual or cell being treated, and can be performed either for prophylaxis or during the course of clinical

pathology. Desirable effects of treatment include preventing occurrence or recurrence of disease, alleviation of symptoms, diminishment of any direct or indirect pathological consequences of the disease, stabilized (i.e., not worsening) state of disease, decreasing the rate of disease progression, amelioration or palliation of the disease state, prolonging survival as compared to expected survival if not receiving treatment and remission or improved prognosis. In some embodiments, compounds of the invention, such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468, are used to delay development of a disease or disorder or to slow the progression of a disease or disorder. Those in need of treatment include those already with the condition or disorder as well as those prone to have the condition or disorder, (for example, through a genetic mutation) or those in which the condition or disorder is to be prevented.

"Inflammatory disorder" refers to any disease, disorder or syndrome in which an excessive or unregulated inflammatory response leads to excessive inflammatory symptoms, host tissue damage, or loss of tissue function. "Inflammatory disorder" also refers to a pathological state mediated by influx of leukocytes or neutrophil chemotaxis.

"Inflammation" refers to a localized, protective response elicited by injury or destruction of tissues, which serves to destroy, dilute, or wall off (sequester) both the injurious agent and the injured tissue. Inflammation is notably associated with influx of leukocytes or neutrophil chemotaxis. Inflammation can result from infection with pathogenic organisms and viruses and from noninfectious means such as trauma or reperfusion following myocardial infarction or stroke, immune responses to foreign antigens, and autoimmune responses. Accordingly, inflammatory disorders amenable to treatment with a compound of the present invention, such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468, encompass disorders associated with reactions of the specific defense system as well as with reactions of the nonspecific defense system.

"Specific defense system" refers to the component of the immune system that reacts to the presence of specific antigens. Examples of inflammation resulting from a response of the specific defense system include the classical response to foreign antigens,

autoimmune diseases, and delayed type hypersensitivity responses mediated by T-cells. Chronic inflammatory diseases, the rejection of solid transplanted tissue and organs, e.g., kidney and bone marrow transplants, and graft versus host disease (GVHD), are further examples of inflammatory reactions of the specific defense system.

5       The term "nonspecific defense system" refers to inflammatory disorders that are mediated by leukocytes that are incapable of immunological memory (e.g., granulocytes, and macrophages). Examples of inflammation that result, at least in part, from a reaction of the nonspecific defense system include inflammation associated with conditions such as adult (acute) respiratory distress syndrome (ARDS) or multiple organ injury  
10 syndromes; reperfusion injury; acute glomerulonephritis; reactive arthritis; dermatoses with acute inflammatory components; acute purulent meningitis or other central nervous system inflammatory disorders such as stroke; thermal injury; inflammatory bowel disease; granulocyte transfusion associated syndromes; and cytokine-induced toxicity.

"Autoimmune disease" refers to any group of disorders in which tissue injury is  
15 associated with humoral or cell-mediated responses to the body's own constituents. Non-limiting examples of autoimmune diseases include rheumatoid arthritis, lupus and multiple sclerosis.

"Allergic disease" as used herein refers to any symptoms, tissue damage, or loss of tissue function resulting from allergy. "Arthritic disease" as used herein refers to any  
20 disease that is characterized by inflammatory lesions of the joints attributable to a variety of etiologies. "Dermatitis" as used herein refers to any of a large family of diseases of the skin that are characterized by inflammation of the skin attributable to a variety of etiologies. "Transplant rejection" as used herein refers to any immune reaction directed against grafted tissue, such as organs or cells (e.g., bone marrow), characterized by a loss  
25 of function of the grafted and surrounding tissues, pain, swelling, leukocytosis, and thrombocytopenia. The therapeutic methods of the present invention include methods for the treatment of disorders associated with inflammatory cell activation.

"Inflammatory cell activation" refers to the induction by a stimulus (including, but not limited to, cytokines, antigens or auto-antibodies) of a proliferative cellular response,  
30 the production of soluble mediators (including but not limited to cytokines, oxygen radicals, enzymes, prostanoids, or vasoactive amines), or cell surface expression of new

or increased numbers of mediators (including, but not limited to, major histocompatibility antigens or cell adhesion molecules) in inflammatory cells (including but not limited to monocytes, macrophages, T lymphocytes, B lymphocytes, granulocytes (i.e., polymorphonuclear leukocytes such as neutrophils, basophils, and eosinophils),  
5 mast cells, dendritic cells, Langerhans cells, and endothelial cells). It will be appreciated by persons skilled in the art that the activation of one or a combination of these phenotypes in these cells can contribute to the initiation, perpetuation, or exacerbation of an inflammatory disorder.

In some embodiments, inflammatory disorders which can be treated according to  
10 the methods of this invention include, but are not limited to, asthma, rhinitis (e.g., allergic rhinitis), allergic airway syndrome, atopic dermatitis, bronchitis, rheumatoid arthritis, psoriasis, contact dermatitis, chronic obstructive pulmonary disease and delayed hypersensitivity reactions.

The terms “cancer” and “cancerous”, “neoplasm”, and “tumor” and related terms  
15 refer to or describe the physiological condition in mammals that is typically characterized by unregulated cell growth. A “tumor” comprises one or more cancerous cells. Examples of cancer include carcinoma, blastoma, sarcoma, seminoma, glioblastoma, melanoma, leukemia, and myeloid or lymphoid malignancies. More particular examples of such cancers include squamous cell cancer (e.g., epithelial squamous cell cancer) and  
20 lung cancer including small-cell lung cancer, non-small cell lung cancer (“NSCLC”), adenocarcinoma of the lung and squamous carcinoma of the lung. Other cancers include skin, keratoacanthoma, follicular carcinoma, hairy cell leukemia, buccal cavity, pharynx (oral), lip, tongue, mouth, salivary gland, esophageal, larynx, hepatocellular, gastric, stomach, gastrointestinal, small intestine, large intestine, pancreatic, cervical, ovarian,  
25 liver, bladder, hepatoma, breast, colon, rectal, colorectal, genitourinary, biliary passage, thyroid, papillary, hepatic, endometrial, uterine, salivary gland, kidney or renal, prostate, testis, vulval, peritoneum, anal, penile, bone, multiple myeloma, B-cell lymphoma, central nervous system, brain, head and neck, Hodgkin’s, and associated metastases. Examples of neoplastic disorders include myeloproliferative disorders, such as  
30 polycythemia vera, essential thrombocytosis, myelofibrosis, such as primary myelofibrosis, and chronic myelogenous leukemia (CML).

A "chemotherapeutic agent" is an agent useful in the treatment of a given disorder, for example, cancer or inflammatory disorders. Examples of chemotherapeutic agents are well-known in the art and include examples such as those disclosed in U.S. Publ. Appl. No. 2010/0048557, incorporated herein by reference. Additionally,  
5 chemotherapeutic agents include pharmaceutically acceptable salts, acids or derivatives of any of chemotherapeutic agents, as well as combinations of two or more of them.

"Package insert" is used to refer to instructions customarily included in commercial packages of therapeutic products that contain information about the indications, usage, dosage, administration, contraindications or warnings concerning the  
10 use of such therapeutic products.

The terms "compound(s) of this invention," and "compound(s) of the present invention" and the like, unless otherwise indicated, include compounds of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468, and stereoisomers (including atropisomers),  
15 geometric isomers, tautomers, solvates, metabolites, isotopes, salts (e.g., pharmaceutically acceptable salts), and prodrugs thereof. In some embodiments, solvates, metabolites, isotopes or prodrugs are excluded, or any combination thereof.

Unless otherwise stated, structures depicted herein are also meant to include compounds that differ only in the presence of one or more isotopically enriched atoms.  
20 Exemplary isotopes that can be incorporated into compounds of the present invention, such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468, include isotopes of hydrogen, carbon, nitrogen, oxygen, phosphorus, sulfur, fluorine, chlorine, and iodine, such as  $^2\text{H}$ ,  $^3\text{H}$ ,  $^{11}\text{C}$ ,  $^{13}\text{C}$ ,  $^{14}\text{C}$ ,  $^{13}\text{N}$ ,  $^{15}\text{N}$ ,  $^{15}\text{O}$ ,  $^{17}\text{O}$ ,  $^{18}\text{O}$ ,  $^{32}\text{P}$ ,  $^{33}\text{P}$ ,  $^{35}\text{S}$ ,  $^{18}\text{F}$ ,  $^{36}\text{Cl}$ ,  
25  $^{123}\text{I}$ , and  $^{125}\text{I}$ , respectively. Isotopically-labeled compounds (e.g., those labeled with  $^3\text{H}$  and  $^{14}\text{C}$ ) can be useful in compound or substrate tissue distribution assays. Tritiated (i.e.,  $^3\text{H}$ ) and carbon-14 (i.e.,  $^{14}\text{C}$ ) isotopes can be useful for their ease of preparation and detectability. Further, substitution with heavier isotopes such as deuterium (i.e.,  $^2\text{H}$ ) may afford certain therapeutic advantages resulting from greater metabolic stability (e.g.,  
30 increased in vivo half-life or reduced dosage requirements). In some embodiments, in compounds of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII),

(VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468, one or more hydrogen atoms are replaced by  $^2\text{H}$  or  $^3\text{H}$ , or one or more carbon atoms are replaced by  $^{13}\text{C}$ - or  $^{14}\text{C}$ -enriched carbon. Positron emitting isotopes such as  $^{15}\text{O}$ ,  $^{13}\text{N}$ ,  $^{11}\text{C}$ , and  $^{18}\text{F}$  are useful for positron emission tomography (PET) studies to examine substrate receptor occupancy. Isotopically labeled compounds can generally be prepared by following procedures analogous to those disclosed in the Schemes or in the Examples herein, by substituting an isotopically labeled reagent for a non-isotopically labeled reagent.

It is specifically contemplated that any limitation discussed with respect to one embodiment of the invention may apply to any other embodiment of the invention. Furthermore, any compound or composition of the invention may be used in any method of the invention, and any method of the invention may be used to produce or to utilize any compound or composition of the invention.

The use of the term “or” is used to mean “and/or” unless explicitly indicated to refer to alternatives only or the alternative are mutually exclusive, although the disclosure supports a definition that refers to only alternatives and “and/or.”

Throughout this application, the term “about” is used to indicate that a value includes the standard deviation of error for the device or method being employed to determine the value.

As used herein, “a” or “an” means one or more, unless clearly indicated otherwise. As used herein, “another” means at least a second or more.

Headings used herein are intended only for organizational purposes.

Compounds of the invention may contain one or more asymmetric carbon atoms. Accordingly, the compounds may exist as diastereomers, enantiomers or mixtures thereof. The syntheses of the compounds may employ racemates, diastereomers or enantiomers as starting materials or as intermediates. Mixtures of particular  
5 diastereomeric compounds may be separated, or enriched in one or more particular diastereomers, by chromatographic or crystallization methods. Similarly, enantiomeric mixtures may be separated, or enantiomerically enriched, using the same techniques or others known in the art. Each of the asymmetric carbon or nitrogen atoms may be in the R or S configuration and both of these configurations are within the scope of the  
10 invention.

In the structures shown herein, where the stereochemistry of any particular chiral atom is not specified, then all stereoisomers are contemplated and included as the compounds of the invention. Where stereochemistry is specified by a solid wedge or dashed line representing a particular configuration, then that stereoisomer is so specified  
15 and defined. Unless otherwise specified, if solid wedges or dashed lines are used, relative stereochemistry is intended.

Another aspect includes prodrugs of the compounds of the present invention, such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468, including known  
20 amino-protecting and carboxy-protecting groups which are released, for example hydrolyzed, to yield the compound of the present invention under physiologic conditions.

The term "prodrug" refers to a precursor or derivative form of a pharmaceutically active substance that is less efficacious to the patient compared to the parent drug and is capable of being enzymatically or hydrolytically activated or converted into the more  
25 active parent form. See, e.g., Wilman, "Prodrugs in Cancer Chemotherapy" Biochemical Society Transactions, 14, pp. 375-382, 615th Meeting Belfast (1986) and Stella et al., "Prodrugs: A Chemical Approach to Targeted Drug Delivery," Directed Drug Delivery, Borchardt et al., (ed.), pp. 247-267, Humana Press (1985). Prodrugs include, but are not limited to, phosphate-containing prodrugs, thiophosphate-containing prodrugs, sulfate-  
30 containing prodrugs, peptide-containing prodrugs, D-amino acid-modified prodrugs, glycosylated prodrugs,  $\beta$ -lactam-containing prodrugs, optionally substituted

phenoxyacetamide-containing prodrugs or optionally substituted phenylacetamide-containing prodrugs, and 5-fluorocytosine and 5-fluorouridine prodrugs.

A particular class of prodrugs are compounds in which a nitrogen atom in an amino, amidino, aminoalkyleneamino, iminoalkyleneamino or guanidino group is substituted with a hydroxy group, an alkylcarbonyl (-CO-R) group, an alkoxycarbonyl (-CO-OR), or an acyloxyalkyl-alkoxycarbonyl (-CO-O-R-O-CO-R) group where R is a monovalent or divalent group, for example alkyl, alkylene or aryl, or a group having the Formula -C(O)-O-CP1P2-haloalkyl, where P1 and P2 are the same or different and are hydrogen, alkyl, alkoxy, cyano, halogen, alkyl or aryl. In a particular embodiment, the nitrogen atom is one of the nitrogen atoms of the amidino group of the compounds of Formula (00A), (0A) or (A) or a subformula thereof. Prodrugs may be prepared by reacting a compound of the present invention, such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468, with an activated group, such as acyl groups, to bond, for example, a nitrogen atom in the compound to the exemplary carbonyl of the activated acyl group. Examples of activated carbonyl compounds are those containing a leaving group bonded to the carbonyl group, and include, for example, acyl halides, acyl amines, acyl pyridinium salts, acyl alkoxides, acyl phenoxides such as p-nitrophenoxy acyl, dinitrophenoxy acyl, fluorophenoxy acyl, and difluorophenoxy acyl. The reactions are generally carried out in inert solvents at reduced temperatures such as -78 to about 50°C. The reactions may also be carried out in the presence of an inorganic base, for example potassium carbonate or sodium bicarbonate, or an organic base such as an amine, including pyridine, trimethylamine, triethylamine, triethanolamine, or the like.

Additional types of prodrugs are also encompassed. For instance, a free carboxyl group of a compound of the invention, such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or suitable free carboxyl-containing compound of Table 1 or of Examples 1-468, can be derivatized as an amide or alkyl ester. As another example, compounds of the present invention comprising free hydroxy groups can be derivatized as prodrugs by converting the hydroxy group into a group such as, but not limited to, a phosphate ester, hemisuccinate, dimethylaminoacetate, or phosphoryloxymethyloxycarbonyl group, as outlined in

Fleisher, D. et al., (1996) Improved oral drug delivery: solubility limitations overcome by the use of prodrugs *Advanced Drug Delivery Reviews*, 19:115. Carbamate prodrugs of hydroxy and amino groups are also included, as are carbonate prodrugs, sulfonate esters and sulfate esters of hydroxy groups. Derivatization of hydroxy groups as (acyloxy)methyl and (acyloxy)ethyl ethers, wherein the acyl group can be an alkyl ester optionally substituted with groups including, but not limited to, ether, amine and carboxylic acid functionalities, or where the acyl group is an amino acid ester as described above, are also encompassed. Prodrugs of this type are described in *J. Med. Chem.*, (1996), 39:10. More specific examples include replacement of the hydrogen atom of the alcohol group with a group such as (C<sub>1</sub>-C<sub>6</sub>)alkanoyloxymethyl, 1-((C<sub>1</sub>-C<sub>6</sub>)alkanoyloxy)ethyl, 1-methyl-1-((C<sub>1</sub>-C<sub>6</sub>)alkanoyloxy)ethyl, (C<sub>1</sub>-C<sub>6</sub>)alkoxycarbonyloxymethyl, N-(C<sub>1</sub>-C<sub>6</sub>)alkoxycarbonylaminomethyl, succinoyl, (C<sub>1</sub>-C<sub>6</sub>)alkanoyl, alpha-amino(C<sub>1</sub>-C<sub>4</sub>)alkanoyl, arylacyl and alpha-aminoacyl, or alpha-aminoacyl-alpha-aminoacyl, where each alpha-aminoacyl group is independently selected from the naturally occurring L-amino acids, P(O)(OH)<sub>2</sub>, -P(O)(O(C<sub>1</sub>-C<sub>6</sub>)alkyl)<sub>2</sub> or glycosyl (the radical resulting from the removal of a hydroxyl group of the hemiacetal form of a carbohydrate).

“Leaving group” refers to a portion of a first reactant in a chemical reaction that is displaced from the first reactant in the chemical reaction. Examples of leaving groups include, but are not limited to, halogen atoms, alkoxy and sulfonyloxy groups. Example sulfonyloxy groups include, but are not limited to, alkylsulfonyloxy groups (for example methyl sulfonyloxy (mesylate group) and trifluoromethylsulfonyloxy (triflate group)) and arylsulfonyloxy groups (for example p-toluenesulfonyloxy (tosylate group) and p-nitrosulfonyloxy (nosylate group)).

## SYNTHESIS OF JANUS KINASE INHIBITOR COMPOUNDS

Compounds of the present invention may be synthesized by synthetic routes described herein. In certain embodiments, processes well-known in the chemical arts can be used, in addition to, or in light of, the description contained herein. The starting materials are generally available from commercial sources such as Aldrich Chemicals (Milwaukee, Wis.) or are readily prepared using methods well known to those skilled in

the art (e.g., prepared by methods generally described in Louis F. Fieser and Mary Fieser, Reagents for Organic Synthesis, v. 1-19, Wiley, N.Y. (1967-1999 ed.), Beilsteins Handbuch der organischen Chemie, 4, Aufl. ed. Springer-Verlag, Berlin, including supplements (also available via the Beilstein online database)), or Comprehensive  
5 Heterocyclic Chemistry, Editors Katrizky and Rees, Pergamon Press, 1984.

Compounds may be prepared singly or as compound libraries comprising at least 2, for example 5 to 1,000 compounds, or 10 to 100 compounds. Libraries of compounds may be prepared by a combinatorial 'split and mix' approach or by multiple parallel syntheses using either solution phase or solid phase chemistry, by procedures known to  
10 those skilled in the art. Thus according to a further aspect of the invention there is provided a compound library comprising at least 2 compounds of the present invention, such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468.

For illustrative purposes, reaction Schemes 1-26 depicted below provide routes  
15 for synthesizing the compounds of the present invention as well as key intermediates. For a more detailed description of the individual reaction steps, see the Examples section below. Those skilled in the art will appreciate that other synthetic routes may be used. Although some specific starting materials and reagents are depicted in the Schemes and discussed below, other starting materials and reagents can be substituted to provide a  
20 variety of derivatives or reaction conditions. In addition, many of the compounds prepared by the methods described below can be further modified in light of this disclosure using conventional chemistry well known to those skilled in the art.

In the preparation of compounds of the present invention, protection of remote functionality (e.g., primary or secondary amine) of intermediates may be necessary. The  
25 need for such protection will vary depending on the nature of the remote functionality and the conditions of the preparation methods. Suitable amino-protecting groups include acetyl, trifluoroacetyl, benzyl, phenylsulfonyl, t-butoxycarbonyl (BOC), benzyloxycarbonyl (CBz) and 9-fluorenylmethylenecarbonyl (Fmoc). The need for such protection is readily determined by one skilled in the art. For a general description  
30 of protecting groups and their use, see T. W. Greene, Protective Groups in Organic Synthesis, John Wiley & Sons, New York, 1991.

Other conversions commonly used in the synthesis of compounds of the present invention, and which can be carried out using a variety of reagents and conditions, include the following:

- 5 (1) Reaction of a carboxylic acid with an amine to form an amide. Such a transformation can be achieved using various reagents known to those skilled in the art but a comprehensive review can be found in *Tetrahedron*, 2005, 61, 10827-10852.
- 10 (2) Reaction of a primary or secondary amine with an aryl halide or pseudo halide, e.g., a triflate, commonly known as a "Buchwald-Hartwig cross-coupling," can be achieved using a variety of catalysts, ligands and bases. A review of these methods is provided in *Comprehensive Organic Name Reactions and Reagents*, 2010, 575-581.
- 15 (3) A palladium cross-coupling reaction between an aryl halide and a vinyl boronic acid or boronate ester. This transformation is a type of "Suzuki-Miyaura cross-coupling," a class of reaction that has been thoroughly reviewed in *Chemical Reviews*, 1995, 95(7), 2457-2483.
- 20 (4) The hydrolysis of an ester to give the corresponding carboxylic acid is well known to those skilled in the art and conditions include: for methyl and ethyl esters, the use of a strong aqueous base such as lithium, sodium or potassium hydroxide or a strong aqueous mineral acid such as HCl; for a tert-butyl ester, hydrolysis would be carried out using acid, for example, HCl in dioxane or trifluoroacetic acid (TFA) in dichloromethane (DCM).

Other exemplary transformations are discussed following the Schemes below.

Reaction Scheme 1

Compounds of formula 6 can be synthesized as shown in reaction Scheme 1. Trichloroacetonitrile can be reacted with cyanoacetic acid ethyl ester to give compound 1. Compound 1 can be condensed with hydrazine to give compound 2, which can then be condensed with 1,1,3,3-tetramethoxypropane to give compound 3. Amine 3 can be doubly Boc-protected to give compound 4, which can then be hydrolyzed with lithium hydroxide to give carboxylic acid 5. Carboxylic acid 5 can then be coupled to various amines in the presence of PyAOP, DIEA, and DMAP to give compounds of formula 6.

10

## Reaction Scheme 2

A method for the synthesis of compounds of Formula 5 is illustrated in Reaction Scheme 2.  $\alpha$ -Bromoketones can be generated from compound 1 with a reagent such as bromine. Alkylation of di-tert-butyl iminodicarbonate with sodium hydride and various  $\alpha$ -bromoketones 2 generates compound 3. Compound 3 can be heated with DMFDMA to give compound 4. Cyclization of compound 4 with hydrazine in ethanol provides pyrazole compound 5. Coupling of compound 5 with pyrazolo[1,5-a]pyrimidine-3-carboxylic acid in the presence of PyAOP, DIEA, and DMAP provides compounds of Formula 6.

Reaction Scheme 3

10

An alternative method for the synthesis of compounds of Formula 6 is described in Reaction Scheme 3. Alkylation of potassium phthalimide with  $\alpha$ -bromoketones 1 generates compound 2. Condensation with DMFDMA yields compounds 3. Compound 3 may be cyclized with hydrazine to yield compound 4, which may then be coupled with pyrazolo[1,5-a]pyrimidine-3-carboxylic acid under amide formation conditions using HATU to provide compounds of Formula 5. Alkylation of compound 5 with alkyl halides in the presence of cesium carbonate gives compounds of Formula 6.

15

Reaction Scheme 4

Reaction Scheme 4 illustrates an alternate synthesis for compounds of formula 5. Nitro-SEM pyrazole compound 1, prepared as in Reaction Scheme 5, may be regioselectively deprotonated with lithium hexamethyldisilazide at low temperature and quenched with iodine to yield 2. The nitro group of compound 2 can be reduced in the presence of iron and ammonium chloride, followed by Boc protection to generate compound 3. Compound 3 may be coupled under Suzuki conditions with aryl boronic acids or aryl boronates to yield compounds 4. After cleavage of the Boc group with tin tetrachloride, compounds of formula 5 are obtained.

10

#### Reaction Scheme 5

An alternate method for the synthesis of compounds of Formula 6a and 6b is shown in Reaction Scheme 5. Commercially available 4-nitro-1H-pyrazole may be protected with a [β-(trimethylsilyl)ethoxy]methyl (SEM) group by treatment with sodium

15

hydride and (2-(chloromethoxy)ethyl)trimethylsilane. The resulting compound 1 can be arylated with aryl bromides or iodides under palladium catalyzed conditions to generate 4-nitro-5-aryl-pyrazoles of formula 2. The nitro group of compounds 2 can be reduced in the presence of iron and ammonium chloride to generate amino pyrazoles 3. Amide bond coupling with commercially available pyrazolo[1,5-a]pyrimidine-3-carboxylic acid in the presence of PyAOP, DIEA, and DMAP provides compounds 4. Removal of the SEM protecting group by aqueous HCl in ethanol generates compounds 5, which may be alkylated with alkyl halides in the presence of a suitable base such as cesium carbonate or with Michael acceptors to provide compounds of Formula 6a and 6b.

10

Reaction Scheme 6

An alternate method for the synthesis of compounds of Formula 4a and 4b is shown in Reaction Scheme 6. Commercially available 4-Nitro-1H-pyrazole can be reacted with alkyl bromides in the presence of cesium carbonate at 55°C for 12 hours to give compound 1. Compound 1 can be reacted with aryl bromides in N,N-Dimethylacetamide in the presence of Palladium (II) acetate, Di(1-adamntyl)-n-butylphosphine, potassium carbonate and trimethylacetic acid to give compounds 2a and 2b. The ratio of products 2a:2b varies depending on the substituent R1, but the reaction generally favors formation of product 2b. Compounds 3a and 3b can be reduced to compounds 3a and 3b in the presence of iron and ammonium chloride in ethanol and water. Coupling of compounds 3a and 3b with pyrazolo[1,5-a]pyrimidine-3-carboxylic

15

20

acid in the presence of PyAOP, DIEA, and DMAP can provide compounds of Formula 4a and 4b.

### Reaction Scheme 7

5

Amide bond coupling of 1 with 5-chloro-pyrazolo[1,5-*a*]pyrimidine-3-carbonyl chloride (prepared according to the procedure in Journal of Medicinal Chemistry, 55(22), 10090-10107; 2012) in the presence of triethylamine provides compounds of formula 2.

10 Treatment of 2 with aqueous ammonia generates compounds of formula 3. Removal of the SEM protecting group by aqueous HCl in methanol generates compounds of formula 4, which may be alkylated with alkyl halides in the presence of a suitable base such as cesium carbonate or with Michael acceptors to provide compounds of Formula 5a and 5b.

### Reaction Scheme 8

A method for the synthesis of compounds of Formula 4a and 4b is shown in Reaction Scheme 8. An amide bond coupling of compound 1 with commercially available 6-methyl-pyrazolo[1,5-a]pyrimidine-3-carboxylic acid in the presence of HATU and DIPEA provides compound 2. Removal of the SEM protecting group by aqueous HCl in ethanol generates compounds 3, which may be alkylated with alkyl halides in the presence of a suitable base such as cesium carbonate or with Michael acceptors to provide compounds of Formula 4a and 4b.

#### Reaction Scheme 9

10

Compounds of formula 4 can be synthesized as shown in reaction Scheme 9. Pyrazole compound 1 (prepared as described herein) may be alkylated with t-butyl-bromoacetate in the presence of cesium carbonate to give intermediate 2. 2 may be treated with trifluoroacetic acid to give acids 3, which may then be reacted with primary or secondary amines in the presence of a coupling reagent such as N,N,N',N'-tetramethyl-O-(7-azabenzotriazol-1-yl)uronium hexafluorophosphate (HATU) to give compounds of formula 4.

Reaction Scheme 10

According to Scheme 10, compound 1 can be reacted with an  $\alpha$ -haloamide in the presence of a base such as cesium carbonate and subsequently deprotected under aqueous acidic conditions to give compounds of type 2. Compounds of type 2 can be reacted with either primary or secondary amines under reductive conditions to give compounds of type 4 and 3 respectively, using a reducing agent for example sodium triacetoxyborohydride.

Intermediate 3 can be further elaborated by reaction with aldehydes in the presence of an appropriate reducing agent such as sodium triacetoxyborohydride to give compounds 4.

### Reaction Scheme 11

5

Pyrazole compounds of the formula 1 may be elaborated via a copper catalyzed coupling with for example a phenyl iodide containing a secondary or tertiary amine sidechain to afford compound 2.

### Reaction Scheme 12

10

Treatment of compound 3 with thiourea in an appropriate solvent such as ethanol with heating provides thiazole compound 4. Aminothiazole 4 can be converted to the bromide 5 by treatment with tBuONO, CuBr<sub>2</sub> in a suitable solvent, for example acetonitrile. Subsequent hydrolysis of compound 5 using an aqueous base such as potassium hydroxide in a compatible solvent like ethanol will afford acid (6). Compound 7 can be prepared by treatment of compound 6 with diphenylphosphoryl azide (DPPA) in tert-butanol followed by deprotection under acidic conditions. Activation of pyrazolo[1,5-a]pyrimidine-3-carboxylic acid with thionyl chloride in a solvent such as THF in the presence of a base like DIPEA and subsequent reaction with 7 to give compound 8. Demethylation of aryl methylether 8 with for example BBr<sub>3</sub> in DCM followed by alkylation with sodium chlorodifluoroacetate and an appropriate base and solvent combination such as cesium carbonate in DMF will give compound 10.

### Reaction Scheme 13

15

Alternatively compounds of Formula 6 can be synthesized as shown in Reaction Scheme 13. For example, compounds 1 can be prepared by treatment of commercially available substituted acetophenones with diethyl carbonate and subsequent bromination using for example bromine in dioxane. Treatment of compounds 1 with a suitably substituted thioamide or thiourea provides thiazole compounds 2. Compounds 2 can be hydrolysed using an aqueous base such as potassium hydroxide in a compatible solvent

20

such as THF to afford acid compounds 35. Compounds 4 can be prepared by treatment of compounds 3 with diphenylphosphoryl azide (DPPA) in tert-butanol. Deprotection of compounds 4 under acidic conditions provides amino compounds 5. Compounds of formula 6 can be prepared by treatment of compounds 5 with pyrazolo[1,5-a]pyrimidine-3-carbonyl chloride in pyridine.

Reaction Scheme 14

Compounds of type 1 can be reacted with suitable nucleophiles such as appropriately mono-substituted cyclic diamines, acetal containing cyclic amines and

cyclic amines containing a substituted second amino group can be achieved with heating in a solvent such as DMA to give compounds 7, 2 and 6 respectively. Compounds of type 2 can be deprotected under aqueous acidic conditions to provide structures of type 3. Compounds 3 can be reductively aminated with mono or di-substituted amines, with regards to the mono substituted amino products they can be further elaborated via a reductively alkylated with a suitable aldehyde in the presence of a reducing agent such as sodium cyanoborohydride giving compounds of type 5.

### Reaction Scheme 15

10

Compound 1 can undergo a Sonogashira reaction with an N-substituted propargyl amine or propargyl alcohol to give compounds 2 and 3 respectively in the presence of a palladium source, a copper (i) halide and base in an appropriate solvent with heating. For example, this could be a combination of  $Pd(PPh_3)_2Cl_2$ ,  $Cu(I)I$ ,  $Et_3N$  in THF. Alcohol 3

can be converted to the bromide 4 with  $\text{CBr}_4$ ,  $\text{PPh}_3$  in a suitable solvent such as DCM. The bromide can be then displaced with primary and secondary amines giving structures of type 5.

#### Reaction Scheme 17

As shown in Scheme 17, compounds of type 1 can be alkylated with amine containing electrophiles to produce compounds 2. Manipulation of functional groups on the pendant amine can produce structures of type 3 and 4.

#### Reaction Scheme 18

As shown in Scheme 18, compounds of type 1 can be reacted with allylic dihalides to produce compounds 2. Further reaction of the pendant allylic halide with amine nucleophiles can produce structures of type 4.

#### Reaction Scheme 19

As shown in Scheme 19, compounds of type 1 can be reacted with substituted piperazines and an appropriate dehydrating agent (such as HATU) to produce structures of type 4. Alternatively, compounds of type 1 can be coupled with appropriately mono-

protected piperazines to produce compounds 2. Compounds 2 can then be deprotected and further reacted with appropriate electrophiles to produce structures of type 4.

Reaction Scheme 20

- 5 As shown in Scheme 20, compounds of type 1 can be reacted with epoxides in the presence of a Lewis acid such as  $Yb(OTf)_3$  to produce structures such as 2 and 3. Deprotection can then produce structures of type 4 and 5.

Reaction Scheme 21

As shown in Scheme 21, compounds of type 1 can be reacted with epoxides in the presence of a Lewis acid such as  $\text{Yb}(\text{OTf})_3$  to produce structures such as 2. The resulting alcohol can then be oxidized to produce structures of type 3.

10

Reaction Scheme 23

As shown in Scheme 23, reaction of compounds of type 1 with propargyl bromide or chloride in the presence of a base can produce compounds of type 2. Reaction of 2 with

azide compounds such as 3 in the presence of a copper halide and organic base, followed by deprotection can lead to triazole compounds of type 4. Further manipulation of the reactive amine can then produce structures of type 5.

#### Reaction Scheme 24

5

As shown in Scheme 24, reaction of compounds of type 1 with a 2-(halomethyl)oxirane can produce compounds of type 2. Reaction of compounds of type 2 with nucleophilic amines can lead to compounds of type 3. Oxidation of 3 leads to compounds of type 4.

#### Reaction Scheme 25

As shown in Scheme 25, reaction of compounds of type 1 with appropriate allylic alkylating reagents in the presence of base leads to compounds of type 2. Deprotection of the amino protecting group under acidic conditions, followed by reductive amination or alkylation of the reactive amine leads to compounds of type 3.

## Reaction Scheme 26

As shown in Scheme 26, reaction of compounds of type 1 with appropriate allylic alkylating reagents leads to compounds of type 2. Removal of the ketal protecting group under acidic conditions, followed by reaction of the liberated ketone with an amine under reductive amination conditions leads to compounds of type 3. A subsequent reductive amination or alkylation step produces structures of type 3.

It will be appreciated that where appropriate functional groups exist, compounds of various formulae or any intermediates used in their preparation may be further derivatised by one or more standard synthetic methods employing condensation, substitution, oxidation, reduction, or cleavage reactions. Particular substitution approaches include conventional alkylation, arylation, heteroarylation, acylation, sulfonylation, halogenation, nitration, formylation and coupling procedures.

In a further example, primary amine or secondary amine groups may be converted into amide groups (-NHCOR' or -NRCOR') by acylation. Acylation may be achieved by reaction with an appropriate acid chloride in the presence of a base, such as triethylamine, in a suitable solvent, such as dichloromethane, or by reaction with an appropriate carboxylic acid in the presence of a suitable coupling agent such as HATU (O-(7-

azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluorophosphate) in a suitable solvent such as dichloromethane. Similarly, amine groups may be converted into sulphonamide groups ( $-\text{NH}\text{SO}_2\text{R}'$  or  $-\text{NR}''\text{SO}_2\text{R}'$ ) groups by reaction with an appropriate sulphonyl chloride in the presence of a suitable base, such as triethylamine, in a suitable solvent such as dichloromethane. Primary or secondary amine groups can be converted into urea groups ( $-\text{NHCONR}'\text{R}''$  or  $-\text{NRCONR}'\text{R}''$ ) by reaction with an appropriate isocyanate in the presence of a suitable base such as triethylamine, in a suitable solvent, such as dichloromethane.

An amine ( $-\text{NH}_2$ ) may be obtained by reduction of a nitro ( $-\text{NO}_2$ ) group, for example by catalytic hydrogenation, using for example hydrogen in the presence of a metal catalyst, for example palladium on a support such as carbon in a solvent such as ethyl acetate or an alcohol e.g. methanol. Alternatively, the transformation may be carried out by chemical reduction using for example a metal, e.g. tin or iron, in the presence of an acid such as hydrochloric acid.

In a further example, amine ( $-\text{CH}_2\text{NH}_2$ ) groups may be obtained by reduction of nitriles ( $-\text{CN}$ ), for example by catalytic hydrogenation using for example hydrogen in the presence of a metal catalyst, for example palladium on a support such as carbon, or Raney nickel, in a solvent such as an ether e.g. a cyclic ether such as tetrahydrofuran, at an appropriate temperature, for example from about  $-78^\circ\text{C}$  to the reflux temperature of the solvent.

In a further example, amine ( $-\text{NH}_2$ ) groups may be obtained from carboxylic acid groups ( $-\text{CO}_2\text{H}$ ) by conversion to the corresponding acyl azide ( $-\text{CON}_3$ ), Curtius rearrangement and hydrolysis of the resultant isocyanate ( $-\text{N}=\text{C}=\text{O}$ ).

Aldehyde groups ( $-\text{CHO}$ ) may be converted to amine groups ( $-\text{CH}_2\text{NR}'\text{R}''$ ) by reductive amination employing an amine and a borohydride, for example sodium triacetoxyborohydride or sodium cyanoborohydride, in a solvent such as a halogenated hydrocarbon, for example dichloromethane, or an alcohol such as ethanol, where necessary in the presence of an acid such as acetic acid at around ambient temperature.

In a further example, aldehyde groups may be converted into alkenyl groups ( $-\text{CH}=\text{CHR}'$ ) by the use of a Wittig or Wadsworth-Emmons reaction using an appropriate phosphorane or phosphonate under standard conditions known to those skilled in the art.

Aldehyde groups may be obtained by reduction of ester groups (such as  $-\text{CO}_2\text{Et}$ ) or nitriles ( $-\text{CN}$ ) using diisobutylaluminium hydride in a suitable solvent such as toluene. Alternatively, aldehyde groups may be obtained by the oxidation of alcohol groups using any suitable oxidising agent known to those skilled in the art.

5        Ester groups ( $-\text{CO}_2\text{R}'$ ) may be converted into the corresponding acid group ( $-\text{CO}_2\text{H}$ ) by acid- or base-catalysed hydrolysis, depending on the nature of R. If R is *t*-butyl, acid-catalysed hydrolysis can be achieved for example by treatment with an organic acid such as trifluoroacetic acid in an aqueous solvent, or by treatment with an inorganic acid such as hydrochloric acid in an aqueous solvent.

10       Carboxylic acid groups ( $-\text{CO}_2\text{H}$ ) may be converted into amides ( $\text{CONHR}'$  or  $-\text{CONR}'\text{R}''$ ) by reaction with an appropriate amine in the presence of a suitable coupling agent, such as HATU, in a suitable solvent such as dichloromethane.

      In a further example, carboxylic acids may be homologated by one carbon (i.e.  $-\text{CO}_2\text{H}$  to  $-\text{CH}_2\text{CO}_2\text{H}$ ) by conversion to the corresponding acid chloride ( $-\text{COCl}$ ) followed  
15 by Arndt-Eistert synthesis.

      In a further example,  $-\text{OH}$  groups may be generated from the corresponding ester (e.g.  $-\text{CO}_2\text{R}'$ ), or aldehyde ( $-\text{CHO}$ ) by reduction, using for example a complex metal hydride such as lithium aluminium hydride in diethyl ether or tetrahydrofuran, or sodium borohydride in a solvent such as methanol. Alternatively, an alcohol may be prepared by  
20 reduction of the corresponding acid ( $-\text{CO}_2\text{H}$ ), using for example lithium aluminium hydride in a solvent such as tetrahydrofuran, or by using borane in a solvent such as tetrahydrofuran.

      Alcohol groups may be converted into leaving groups, such as halogen atoms or sulfonyloxy groups such as an alkylsulfonyloxy, e.g. trifluoromethylsulfonyloxy or  
25 arylsulfonyloxy, e.g. *p*-toluenesulfonyloxy group using conditions known to those skilled in the art. For example, an alcohol may be reacted with thionyl chloride in a halogenated hydrocarbon (e.g. dichloromethane) to yield the corresponding chloride. A base (e.g. triethylamine) may also be used in the reaction.

      In another example, alcohol, phenol or amide groups may be alkylated by  
30 coupling a phenol or amide with an alcohol in a solvent such as tetrahydrofuran in the presence of a phosphine, e.g. triphenylphosphine and an activator such as diethyl-

diisopropyl, or dimethylazodicarboxylate. Alternatively alkylation may be achieved by deprotonation using a suitable base e.g. sodium hydride followed by subsequent addition of an alkylating agent, such as an alkyl halide.

Aromatic halogen substituents in the compounds may be subjected to halogen-metal exchange by treatment with a base, for example a lithium base such as *n*-butyl or *t*-butyl lithium, optionally at a low temperature, e.g. around  $-78^{\circ}\text{C}$ , in a solvent such as tetrahydrofuran, and then quenched with an electrophile to introduce a desired substituent. Thus, for example, a formyl group may be introduced by using *N,N*-dimethylformamide as the electrophile. Aromatic halogen substituents may alternatively  
5 be subjected to metal (e.g. palladium or copper) catalysed reactions, to introduce, for example, acid, ester, cyano, amide, aryl, heteraryl, alkenyl, alkynyl, thio- or amino substituents. Suitable procedures which may be employed include those described by Heck, Suzuki, Stille, Buchwald or Hartwig.  
10

Aromatic halogen substituents may also undergo nucleophilic displacement  
15 following reaction with an appropriate nucleophile such as an amine or an alcohol. Advantageously, such a reaction may be carried out at elevated temperature in the presence of microwave irradiation.

#### METHODS OF SEPARATION

20 In each of the exemplary Schemes it may be advantageous to separate reaction products from one another or from starting materials. The desired products of each step or series of steps is separated or purified (hereinafter separated) to the desired degree of homogeneity by the techniques common in the art. Typically such separations involve multiphase extraction, crystallization or trituration from a solvent or solvent mixture,  
25 distillation, sublimation, or chromatography. Chromatography can involve any number of methods including, for example: reverse-phase and normal phase; size exclusion; ion exchange; supercritical fluid; high, medium, and low pressure liquid chromatography methods and apparatus; small scale analytical; simulated moving bed (SMB) and preparative thin or thick layer chromatography, as well as techniques of small scale thin  
30 layer and flash chromatography.

Another class of separation methods involves treatment of a mixture with a reagent selected to bind to or render otherwise separable a desired product, unreacted starting material, reaction by product, or the like. Such reagents include adsorbents or absorbents such as activated carbon, molecular sieves, ion exchange media, or the like.

- 5 Alternatively, the reagents can be acids in the case of a basic material, bases in the case of an acidic material, binding reagents such as antibodies, binding proteins, selective chelators such as crown ethers, liquid/liquid ion extraction reagents (LIX), or the like.

Selection of appropriate methods of separation depends on the nature of the materials involved. Example separation methods include boiling point, and molecular  
10 weight in distillation and sublimation, presence or absence of polar functional groups in chromatography, stability of materials in acidic and basic media in multiphase extraction, and the like. One skilled in the art will apply techniques most likely to achieve the desired separation.

Diastereomeric mixtures can be separated into their individual diastereoisomers  
15 on the basis of their physical chemical differences by methods well known to those skilled in the art, such as by chromatography or fractional crystallization. Enantiomers can be separated by converting the enantiomeric mixture into a diastereomeric mixture by reaction with an appropriate optically active compound (e.g., chiral auxiliary such as a chiral alcohol or Mosher's acid chloride), separating the diastereoisomers and converting  
20 (e.g., hydrolyzing) the individual diastereoisomers to the corresponding pure enantiomers. Also, some of the compounds of the present invention may be atropisomers (e.g., substituted biaryls) and are considered as part of this invention. Enantiomers can also be separated by use of a chiral HPLC column or supercritical fluid chromatography.

A single stereoisomer, e.g., an enantiomer, substantially free of its stereoisomer  
25 may be obtained by resolution of the racemic mixture using a method such as formation of diastereomers using optically active resolving agents (Eliel, E. and Wilen, S., Stereochemistry of Organic Compounds, John Wiley & Sons, Inc., New York, 1994; Lochmuller, C. H., J. Chromatogr., 113(3):283-302 (1975)). Racemic mixtures of chiral compounds of the invention can be separated and isolated by any suitable method,  
30 including: (1) formation of ionic, diastereomeric salts with chiral compounds and separation by fractional crystallization or other methods, (2) formation of diastereomeric

compounds with chiral derivatizing reagents, separation of the diastereomers, and conversion to the pure stereoisomers, and (3) separation of the substantially pure or enriched stereoisomers directly under chiral conditions. See: Drug Stereochemistry, Analytical Methods and Pharmacology, Irving W. Wainer, Ed., Marcel Dekker, Inc.,  
5 New York (1993).

Diastereomeric salts can be formed by reaction of enantiomerically pure chiral bases such as brucine, quinine, ephedrine, strychnine,  $\alpha$ -methyl- $\beta$ -phenylethylamine (amphetamine), and the like with asymmetric compounds bearing acidic functionality, such as carboxylic acid and sulfonic acid. The diastereomeric salts may be induced to  
10 separate by fractional crystallization or ionic chromatography. For separation of the optical isomers of amino compounds, addition of chiral carboxylic or sulfonic acids, such as camphorsulfonic acid, tartaric acid, mandelic acid, or lactic acid can result in formation of the diastereomeric salts.

Alternatively, the substrate to be resolved is reacted with one enantiomer of a  
15 chiral compound to form a diastereomeric pair (Eliel, E. and Wilen, S., Stereochemistry of Organic Compounds, John Wiley & Sons, Inc., New York, 1994, p. 322). Diastereomeric compounds can be formed by reacting asymmetric compounds with enantiomerically pure chiral derivatizing reagents, such as menthyl derivatives, followed by separation of the diastereomers and hydrolysis to yield the pure or enriched  
20 enantiomer. A method of determining optical purity involves making chiral esters, such as a menthyl ester, e.g., (-) menthyl chloroformate in the presence of base, or Mosher ester,  $\alpha$ -methoxy- $\alpha$ -(trifluoromethyl)phenyl acetate (Jacob, J. Org. Chem. 47:4165 (1982)), of the racemic mixture, and analyzing the NMR spectrum for the presence of the two atropisomeric enantiomers or diastereomers. Stable diastereomers of atropisomeric  
25 compounds can be separated and isolated by normal- and reverse-phase chromatography following methods for separation of atropisomeric naphthyl-isoquinolines (WO 96/15111, incorporated herein by reference). By method (3), a racemic mixture of two enantiomers can be separated by chromatography using a chiral stationary phase (Chiral Liquid Chromatography W. J. Lough, Ed., Chapman and Hall, New York, (1989);  
30 Okamoto, J. of Chromatogr. 513:375-378 (1990)). Enriched or purified enantiomers can be distinguished by methods used to distinguish other chiral molecules with asymmetric

carbon atoms, such as optical rotation and circular dichroism. The absolute stereochemistry of chiral centers and enantiomers can be determined by x-ray crystallography.

Positional isomers, for example E and Z forms, of compounds of Formula (00A),  
5 (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), and intermediates for their synthesis, may be observed by characterization methods such as NMR and analytical HPLC. For certain compounds where the energy barrier for interconversion is sufficiently high, the E and Z isomers may be separated, for example by preparatory HPLC.

## 10 PHARMACEUTICAL COMPOSITIONS AND ADMINISTRATION

The compounds with which the invention is concerned are JAK kinase inhibitors, such as JAK1 inhibitors, and are useful in the treatment of several diseases, for example, inflammatory diseases, such as asthma.

Accordingly, another embodiment provides pharmaceutical compositions or  
15 medicaments containing a compound of the invention, such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468, and a pharmaceutically acceptable carrier, diluent or excipient, as well as methods of using the compounds of the invention to prepare such compositions and medicaments.

20 In one example, a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468, may be formulated by mixing at ambient temperature at the appropriate pH, and at the desired degree of purity, with physiologically acceptable carriers, i.e., carriers that are non-toxic to recipients at the dosages and concentrations employed into a galenical  
25 administration form. The pH of the formulation depends mainly on the particular use and the concentration of compound, but typically ranges anywhere from about 3 to about 8. In one example, a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468, is formulated in an acetate buffer, at pH 5. In another embodiment, the compounds of the  
30 present invention, such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-

468, are sterile. The compound may be stored, for example, as a solid or amorphous composition, as a lyophilized formulation or as an aqueous solution.

Compositions are formulated, dosed, and administered in a fashion consistent with good medical practice. Factors for consideration in this context include the particular disorder being treated, the particular mammal being treated, the clinical condition of the individual patient, the cause of the disorder, the site of delivery of the agent, the method of administration, the scheduling of administration, and other factors known to medical practitioners.

It will be understood that the specific dose level for any particular patient will depend upon a variety of factors including the activity of the specific compound employed, the age, body weight, general health, sex, diet, time of administration, route of administration, rate of excretion, drug combination and the severity of the particular disease undergoing treatment. Optimum dose levels and frequency of dosing will be determined by clinical trial, as is required in the pharmaceutical art. In general, the daily dose range for oral administration will lie within the range of from about 0.001 mg to about 100 mg per kg body weight of a human, often 0.01 mg to about 50 mg per kg, for example 0.1 to 10 mg per kg, in single or divided doses. In general, the daily dose range for inhaled administration will lie within the range of from about 0.1  $\mu$ g to about 1 mg per kg body weight of a human, preferably 0.1  $\mu$ g to 50  $\mu$ g per kg, in single or divided doses. On the other hand, it may be necessary to use dosages outside these limits in some cases.

The compounds of the invention, such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468, may be administered by any suitable means, including oral, topical (including buccal and sublingual), rectal, vaginal, transdermal, parenteral, subcutaneous, intraperitoneal, intrapulmonary, intradermal, intrathecal, inhaled and epidural and intranasal, and, if desired for local treatment, intralesional administration. Parenteral infusions include intramuscular, intravenous, intraarterial, intraperitoneal, or subcutaneous administration. In some embodiments, inhaled administration is employed.

The compounds of the present invention, such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound

of Table 1 or of Examples 1-468, may be administered in any convenient administrative form, e.g., tablets, powders, capsules, lozenges, granules, solutions, dispersions, suspensions, syrups, sprays, vapors, suppositories, gels, emulsions, patches, etc. Such compositions may contain components conventional in pharmaceutical preparations, e.g.,  
5     diluents (e.g., glucose, lactose or mannitol), carriers, pH modifiers, buffers, sweeteners, bulking agents, stabilizing agents, surfactants, wetting agents, lubricating agents, emulsifiers, suspending agents, preservatives, antioxidants, opaquing agents, glidants, processing aids, colorants, perfuming agents, flavoring agents, other known additives as well as further active agents.

10             Suitable carriers and excipients are well known to those skilled in the art and are described in detail in, e.g., Ansel, Howard C., et al., *Ansel's Pharmaceutical Dosage Forms and Drug Delivery Systems*. Philadelphia: Lippincott, Williams & Wilkins, 2004; Gennaro, Alfonso R., et al. *Remington: The Science and Practice of Pharmacy*. Philadelphia: Lippincott, Williams & Wilkins, 2000; and Rowe, Raymond C. *Handbook*  
15     *of Pharmaceutical Excipients*. Chicago, Pharmaceutical Press, 2005. For example, carriers include solvents, dispersion media, coatings, surfactants, antioxidants, preservatives (e.g., antibacterial agents, antifungal agents), isotonic agents, absorption delaying agents, salts, preservatives, drugs, drug stabilizers, gels, binders, excipients, disintegration agents, lubricants, sweetening agents, flavoring agents, dyes, such like  
20     materials and combinations thereof, as would be known to one of ordinary skill in the art (see, for example, *Remington's Pharmaceutical Sciences*, pp 1289-1329, 1990). Except insofar as any conventional carrier is incompatible with the active ingredient, its use in the therapeutic or pharmaceutical compositions is contemplated. Exemplary excipients  
25     include dicalcium phosphate, mannitol, lactose, starch, magnesium stearate, sodium saccharine, cellulose, magnesium carbonate or combinations thereof. A pharmaceutical composition may comprise different types of carriers or excipients depending on whether it is to be administered in solid, liquid or aerosol form, and whether it need to be sterile for such routes of administration.

For example, tablets and capsules for oral administration may be in unit dose  
30     presentation form, and may contain conventional excipients such as binding agents, for example syrup, acacia, gelatin, sorbitol, tragacanth, or polyvinyl-pyrrolidone; fillers, for

example, lactose, sugar, maize-starch, calcium phosphate, sorbitol or glycine; tableting lubricant, for example, magnesium stearate, talc, polyethylene glycol or silica; disintegrants, for example, potato starch, or acceptable wetting agents such as sodium lauryl sulfate. The tablets may be coated according to methods well known in normal pharmaceutical practice. Oral liquid preparations may be in the form of, for example, aqueous or oily suspensions, solutions, emulsions, syrups or elixirs, or may be presented as a dry product for reconstitution with water or other suitable vehicle before use. Such liquid preparations may contain conventional additives such as suspending agents, for example, sorbitol, syrup, methyl cellulose, glucose syrup, gelatin hydrogenated edible fats; emulsifying agents, for example, lecithin, sorbitan monooleate, or acacia; non-aqueous vehicles (which may include edible oils), for example, almond oil, fractionated coconut oil, oily esters such as glycerine, propylene glycol, or ethyl alcohol; preservatives, for example, methyl or propyl p-hydroxybenzoate or sorbic acid, and if desired conventional flavoring or coloring agents.

For topical application to the skin, a compound may be made up into a cream, lotion or ointment. Cream or ointment formulations which may be used for the drug are conventional formulations well known in the art, for example as described in standard textbooks of pharmaceutics such as the British Pharmacopoeia.

Compounds of the invention, such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468, may also be formulated for inhalation, for example, as a nasal spray, or dry powder or aerosol inhalers. For delivery by inhalation, the compound is typically in the form of microparticles, which can be prepared by a variety of techniques, including spray-drying, freeze-drying and micronisation. Aerosol generation can be carried out using, for example, pressure-driven jet atomizers or ultrasonic atomizers, such as by using propellant-driven metered aerosols or propellant-free administration of micronized compounds from, for example, inhalation capsules or other "dry powder" delivery systems.

By way of example, a composition of the invention may be prepared as a suspension for delivery from a nebulizer or as an aerosol in a liquid propellant, for example, for use in a pressurized metered dose inhaler (PMDI). Propellants suitable for

use in a PMDI are known to the skilled person, and include CFC-12, HFA-134a, HFA-227, HCFC-22 ( $\text{CCl}_2\text{F}_2$ ) and HFA-152 ( $\text{CH}_3\text{F}$  and isobutane).

In some embodiments, a composition of the invention is in dry powder form, for delivery using a dry powder inhaler (DPI). Many types of DPI are known.

5        Microparticles for delivery by administration may be formulated with excipients that aid delivery and release. For example, in a dry powder formulation, microparticles may be formulated with large carrier particles that aid flow from the DPI into the lung. Suitable carrier particles are known, and include lactose particles; they may have a mass median aerodynamic diameter of, for example, greater than 90  $\mu\text{m}$ .

10        In the case of an aerosol-based formulation, an example is:

Compound of the invention\* 24 mg / canister

Lecithin, NF Liq. Conc. 1.2 mg / canister

Trichlorofluoromethane, NF 4.025 g / canister

Dichlorodifluoromethane, NF 12.15 g / canister.

15        \* Such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples 1-468.

A compound, such as a compound of Formula (00A), (0A), (A), (Ia), (Ib), (II), (III), (IV), (V), (VI), (VII), (VIII), (IX), or (X), or a compound of Table 1 or of Examples  
20 1-468, may be dosed as described depending on the inhaler system used. In addition to the compound, the administration forms may additionally contain excipients as described above, or, for example, propellants (e.g., Frigen in the case of metered aerosols), surface-active substances, emulsifiers, stabilizers, preservatives, flavorings, fillers (e.g., lactose in the case of powder inhalers) or, if appropriate, further active compounds.

25        For the purposes of inhalation, a large number of systems are available with which aerosols of optimum particle size can be generated and administered, using an inhalation technique which is appropriate for the patient. In addition to the use of adaptors (spacers, expanders) and pear-shaped containers (e.g., Nebulator®, Volumatic®), and automatic devices emitting a puffer spray (Autohaler®), for metered  
30 aerosols, in the case of powder inhalers in particular, a number of technical solutions are available (e.g., Diskhaler®, Rotadisk®, Turbohaler® or the inhalers, for example, as described in U.S. Patent No. 5,263,475, incorporated herein by reference). Additionally,

#### TARGETED INHALED DRUG DELIVERY

Optimisation of drugs for delivery to the lung by topical (inhaled) administration has been recently reviewed (Cooper, A. E. et al. Curr. Drug Metab. 2012, 13, 457-473). Due to limitations in the delivery device, the dose of an inhaled drug is likely to be low  
15       (approximately <1mg/day) in humans which necessitates highly potent molecules. For compounds destined to be delivered via dry powder inhalation there is also a requirement to be able to generate crystalline forms of the compound that can be micronized to 1-5  $\mu\text{m}$  in size. Additionally, the compound needs to maintain a sufficient concentration in the lung over a given time period so as to be able to exert a pharmacological effect of the  
20       desired duration, and for pharmacological targets where systemic inhibition of said target is undesired, to have a low systemic exposure. The lung has an inherently high permeability to both large molecules (proteins, peptides) as well as small molecules with concomitant short lung half-lives, thus it is necessary to attenuate the lung absorption rate through modification of one or more features of the compounds: minimizing membrane  
25       permeability, reducing dissolution rate, or introducing a degree of basicity into the compound to enhance binding to the phospholipid-rich lung tissue or through trapping in acidic sub-cellular compartments such as lysosomes (pH 5). Accordingly, in some embodiments, compounds of the present invention exhibit one or more of these features.

#### MATCHED PAIR ANALYSIS

Figure 1 depicts a matched pair analysis of certain compounds of the present invention containing either an OMe (i) or OCHF<sub>2</sub> (ii) group at the indicated position. Any two dots joined by a line represent two compounds with identical R<sub>1</sub> and R<sub>2</sub> groups, and differing only by an OMe or OCHF<sub>2</sub> substitution at the indicated position. Figure 1  
5 demonstrates that OCHF<sub>2</sub> substituted analogs (ii) are consistently more potent in the JAK1 biochemical assay (described below) than the corresponding OMe analogs (i).

#### General Experimental Details:

5 All solvents and commercial reagents were used as received unless otherwise stated. Where products were purified by chromatography on silica this was carried out using either a glass column manually packed with silica gel (Kieselgel 60, 220-440 mesh, 35-75  $\mu\text{m}$ ) or an Isolute<sup>®</sup> SPE Si II cartridge. 'Isolute SPE Si cartridge' refers to a pre-packed polypropylene column containing unbonded activated silica with irregular

Pyrazolo[1,5-a]pyrimidine-3-carboxylic acid [3-(5-chloro-2-difluoromethoxyphenyl)-1H-pyrazol-4-yl]amide

To a solution of 2-bromo-4-chlorophenol (4.98 g, 24.0 mmol) in DMF (25 mL)  
 5 was added sodium chlorodifluoroacetate (8.42 g, 55.2 mmol), cesium carbonate (10.97 g, 33.67 mmol) and water (2.5 mL). The reaction was stirred at 100 °C for 16 hours. The reaction mixture was partitioned between ethyl acetate and water, the organic portion washed with brine, dried (MgSO<sub>4</sub>), and evaporated. The crude product was purified by flash chromatography on silica eluting with 0-20% EtOAc in heptanes to yield 2-bromo-  
 10 4-chloro-1-(difluoromethoxy)benzene as a clear, colorless oil (2.98 g, 48%). LCMS (ESI) no m/z signal; <sup>1</sup>H NMR (400 MHz, DMSO-*d*<sub>6</sub>) δ: (ppm) 7.90 (d, 1H), 7.54 (dd, 1H), 7.38 (d, 1H), 7.28 (t, 1H).

To a solution of 4-nitro-1-(2-trimethylsilanylethoxymethyl)-1H-pyrazole (preparation described in WO2011003065) (46.5 g, 191 mmol) in DMA (350 mL) was  
 15 added 2-bromo-4-chloro-1-difluoromethoxybenzene (64.0 g, 248 mmol), palladium (II) acetate (2.15 g, 9.6 mmol), di-(adamantyl)-n-butylphosphine (5.0 g, 13.4 mmol), potassium carbonate (79.2 g, 573 mmol) and trimethylacetic acid (5.27 g, 51.6 mmol). The mixture was degassed with nitrogen for 10 minutes then heated at 130 °C for 8 hours. The reaction mixture was allowed to cool to room temperature, diluted with ethyl  
 20 acetate and washed with water and brine, dried (MgSO<sub>4</sub>), filtered and evaporated. The resultant crude material was purified by flash chromatography on silica eluting with 0-10% EtOAc in cyclohexane to afford 5-(5-chloro-2-difluoromethoxyphenyl)-4-nitro-1-(2-trimethylsilanylethoxymethyl)-1H-pyrazole (62.4 g, 78%). <sup>1</sup>H NMR (400MHz, CDCl<sub>3</sub>) δ:

(ppm) 8.24 (s, 1H), 7.52-7.53 (m, 2H), 6.39 (t, 1H), 5.29 - 5.30 (m, 2H), 3.63 - 3.64 (m, 2H), 0.90 (s, 9H).

To a solution of 5-(5-chloro-2-difluoromethoxyphenyl)-4-nitro-1-(2-trimethylsilanylethoxymethyl)-1H-pyrazole (62 g, 148 mmol) in ethanol (600 mL) was added water (200 mL), ammonium chloride (32 g, 590 mmol) and iron powder (41 g, 740 mmol). The mixture was heated at 80 °C for 2 hours then allowed to cool to room temperature. The residual solid was removed by filtration through Celite<sup>®</sup>. The filtrate was evaporated under reduced pressure, diluted with water and extracted twice with DCM. The combined organic extracts were washed with water and brine, dried (MgSO<sub>4</sub>) and evaporated to afford a dark oil. The oil was purified by flash chromatography on silica eluting with 0-25% EtOAc in DCM. Appropriate fractions were collected and the solvent removed *in-vacuo* to afford 5-(5-chloro-2-difluoromethoxyphenyl)-1-(2-trimethylsilyl-ethoxymethyl)-1H-pyrazol-4-ylamine as a brown oil (30.8 g, 54%). <sup>1</sup>H NMR (400MHz, CDCl<sub>3</sub>) δ: (ppm) 7.56 (d, 1H), 7.44 (dd, 1H), 7.34 (s, 1H), 7.30 - 7.25 (m, 1H), 6.37 (t, 1H), 5.29 (s, 2H), 3.56 (t, 2H), 0.88 (dd, 2H), 0.00 (s, 9H).

A solution of 5-(5-chloro-2-difluoromethoxyphenyl)-1-(2-trimethylsilyl-ethoxymethyl)-1H-pyrazol-4-ylamine (60.0g, 154 mmol) in THF (100 mL) was added dropwise over 30 minutes to an ice/water cooled mixture of pyrazolo[1,5-a]pyrimidine-3-carbonyl chloride (27.8 g, 153 mmol), and DIPEA (49.5 g, 383 mmol) in THF (300 mL). On complete addition the mixture was left to stir at room temperature for 1 hour. The solvent was evaporated and the residue diluted with 0.5 N aqueous HCl and extracted with ethyl acetate. The combined organic extract was passed through Celite<sup>®</sup> to remove the residual solid and the filtrate washed with 1M aqueous K<sub>2</sub>CO<sub>3</sub>, water and brine, dried (Na<sub>2</sub>SO<sub>4</sub>) and evaporated to give a red solid. The solid was triturated with 10% diethyl ether in cyclohexane. The solid was collected by filtration, washed with 1:1 diethyl ether in cyclohexane and left to air dry to afford pyrazolo[1,5-a]pyrimidine-3-carboxylic acid [5-(5-chloro-2-difluoromethoxyphenyl)-1-(2-trimethylsilanylethoxymethyl)-1H-pyrazol-4-yl]amide as an off-white solid (59.2 g, 73%). <sup>1</sup>H NMR (300 MHz, CDCl<sub>3</sub>): δ (ppm) 9.61 (s, 1H), 8.77-8.78 (m, 1H), 8.51 (dd, 1H), 8.36 (s, 1H), 7.65 (d, 1H), 7.52 (dd, 1H), 7.36 (d, 1H), 7.29 (s, 1H), 7.01 (dd, 1H), 6.42 (t, 1H), 5.39-5.41 (m, 2H), 3.60-3.64 (m, 2H), 0.87-0.89 (m, 2H), 0.09 (s, 9H).

A suspension of pyrazolo[1,5-a]pyrimidine-3-carboxylic acid [5-(5-chloro-2-difluoromethoxyphenyl)-1-(2-trimethylsilanylethoxymethyl)-1H-pyrazol-4-yl]amide (59.0 g, 110 mmol) in methanol (420 mL) was treated with 6N HCl (80 mL) and the mixture heated at 60 °C for 4 hours. The solvent was evaporated and the residue triturated with water. The solid was collected by filtration, washed with water and left to air dry. The solid was triturated with a minimum volume of acetonitrile, collected by filtration, washed with diethyl ether and dried at 60°C under high vacuum to afford the title compound as a yellow solid (42.9 g, 96%). <sup>1</sup>H NMR (400 MHz, DMSO-*d*<sub>6</sub>) δ: (ppm) 9.71 (s, 1H), 9.34 (dd, 1H), 8.68 - 8.69 (m, 1H), 8.66 (s, 1H), 8.25 (s, 1H), 7.62 (dd, 2H), 7.43 - 7.46 (m, 1H), 7.29 (dd, 1H), 7.23 (d, 1H).

### Enzymatic Assays

25 JAK Enzyme Assays were carried out as follows:

The activity of the isolated recombinant JAK1 and JAK2 kinase domain was measured by monitoring phosphorylation of a peptide derived from JAK3 (Val-Ala-Leu-Val-Asp-Gly-Tyr-Phe-Arg-Leu-Thr-Thr, fluorescently labeled on the N-terminus with 5-carboxyfluorescein) using the Caliper LabChip® technology (Caliper Life Sciences,  
30 Hopkinton, MA). To determine inhibition constants ( $K_i$ ), compounds were diluted

serially in DMSO and added to 50  $\mu$ L kinase reactions containing purified enzyme (1.5 nM JAK1, or 0.2 nM JAK2), 100 mM HEPES buffer (pH 7.2), 0.015% Brij-35, 1.5  $\mu$ M peptide substrate, ATP (25  $\mu$ M), 10 mM  $MgCl_2$ , 4 mM DTT at a final DMSO concentration of 2%. Reactions were incubated at 22  $^{\circ}C$  in 384-well polypropylene microtiter plates for 30 minutes and then stopped by addition of 25  $\mu$ L of an EDTA containing solution (100 mM HEPES buffer (pH 7.2), 0.015% Brij-35, 150 mM EDTA), resulting in a final EDTA concentration of 50 mM. After termination of the kinase reaction, the proportion of phosphorylated product was determined as a fraction of total peptide substrate using the Caliper LabChip<sup>®</sup> 3000 according to the manufacturer's specifications.  $K_i$  values were then determined using the Morrison tight binding model (Morrison, J.F., *Biochim. Biophys. Acta.* 185:269-296 (1969); William, J.W. and Morrison, J.F., *Meth. Enzymol.*, 63:437-467 (1979)) modified for ATP-competitive inhibition [ $K_i = K_{i,app} / (1 + [ATP] / K_{m,app})$ ].

JAK1 Pathway Assay in Cell Lines was carried out as follows:

Inhibitor potency ( $EC_{50}$ ) was determined in cell-based assays designed to measure JAK1 dependent STAT phosphorylation. As noted above, inhibition of IL-4, IL-13, and IL-9 signaling by blocking the Jak/Stat signaling pathway can alleviate asthmatic symptoms in pre-clinical lung inflammation models (Mathew et al., 2001, *J Exp Med* 193(9): 1087-1096; Kudlacz et. al., 2008, *Eur J. Pharmacol* 582(1-3): 154-161).

In one assay approach, TF-1 human erythroleukemia cells obtained from the American Type Culture Collection (ATCC; Manassas, VA) were used to measure JAK1-dependent STAT6 phosphorylation downstream of IL-13 stimulation. Prior to use in the assays, TF-1 cells were starved of GM-CSF overnight in OptiMEM medium (Life Technologies, Grand Island, NY) supplemented with 0.5% charcoal/dextran stripped fetal bovine serum (FBS), 0.1 mM non-essential amino acids (NEAA), and 1 mM sodium pyruvate. The assays were run in 384-well plates in serum-free OptiMEM medium using 300,000 cells per well. In a second assay approach, BEAS-2B human bronchial epithelial cells obtained from ATCC were plated at 100,000 cells per well of a 96-well plate one day prior to the experiment. The BEAS-2B assay was run in complete growth medium (bronchial epithelial basal medium plus bulletkit; Lonza; Basel, Switzerland).

Test compounds were serially diluted 1:2 in DMSO and then diluted 1:50 in medium just before use. Diluted compounds were added to the cells, for a final DMSO concentration of 0.2%, and incubated for 30 min (for the TF-1 assay) or 1 hr (for the BEAS-2B assay) at 37 °C. Then, cells were stimulated with human recombinant cytokine at their respective EC<sub>90</sub> concentrations, as previously determined for each individual lot. Cells were stimulated with IL-13 (R&D Systems, Minneapolis, MN) for 15 min at 37°C. The TF-1 cell reactions were stopped by the direct addition of 10x lysis buffer (Cell Signaling Technologies, Danvers, MA), whereas the BEAS-2B cell incubations were halted by the removal of medium and addition of 1x lysis buffer. The resultant samples were frozen in the plates at -80 °C. Compound mediated inhibition of STAT6 phosphorylation was measured in the cell lysates using MesoScale Discovery (MSD) technology (Gaithersburg, MD). EC<sub>50</sub> values were determined as the concentration of compound required for 50% inhibition of STAT phosphorylation relative to that measured for the DMSO control.

Table 2 provides JAK1 *K<sub>i</sub>*, JAK2 *K<sub>i</sub>* and IL-13-pSTAT6 IC<sub>50</sub> information for the noted Examples of the indicated Tables as well as LCMS (ESI) information.

### Clearance Assay

In certain instances high systemic clearance of a drug substance may be of benefit. For example, in the treatment of pulmonary diseases it may be beneficial to have high drug concentrations in the lung, with lower concentrations in the bloodstream or peripheral organs. In such cases, it may be advantageous to administer a drug substance with high systemic clearance via the inhaled delivery route. This approach may maximize pharmacologic activity of the drug substance in the lung while minimizing the possibility of on-target toxicity elsewhere in the body. The functional groups appended to the 5-chloro-2-difluoromethoxyphenyl pyrazolopyrimidine scaffold affect systemic clearance. For example, compound i exhibits a mouse intravenous (IV) clearance value of 5.3 mL/min/kg, or 6 % of mouse liver blood flow. Representative mouse IV clearance values for examples in the present invention are shown in Table 3.

Female BALB/c mice were obtained from Charles River Labs (Hollister, CA  
5 USA). Twelve animals were given a single IV dose of 1 mg/kg of compounds via the tail  
vein. A representative dose solution was prepared as follows: the compound was  
dissolved in a mixture of 5% dimethylsulfoxide (DMSO), 35% polyethylene glycol (PEG  
400), and 60% water (v/v/v), respectively, and administered at a dosing volume of 5  
mL/kg. Mice weighed approximately 20-25 g at the start of the study. After intravenous  
10 administration of compounds, each animal was bled twice via retro-orbital and cardiac  
puncture. PK time points were collected at 2 min, 5 min, 15 min, 30 min, 1 hr, 2 hr, 4 hr,

and 8 hr post-dose. Plasma samples were stored at approximately -80 °C until thawed for LC-MS/MS analysis. PK data analysis was performed on mean plasma concentration-time data and PK parameters were determined by non compartmental methods using WinNonlin<sup>®</sup> Enterprise, version 5.2.1 (Pharsight Corporation; Mountain View, CA).
