Title of Invention: FLOATING-TYPE STRUCTURE

ABSTRACT

[Problem] To provide a floating-type structure that can be constructed at low cost and in a short delivery time. [Solution] The present invention provides a floating-type structure converted from a liquefied-gas carrier ship including a hull part in which a membrane-type or self-supporting prismatic-type storage tank is mounted. The floating-type structure includes the hull part; a projecting part which is fixed to the hull part and which projects to at least one side in the width direction of the hull part; and a gas-processing facility positioned on the projecting part, in which the projecting part and the gas-processing facility are portions that are added during conversion.
