ABSTRACT

The present disclosure provides an image processing method, a system, a device, a storage medium, and a program product. The method comprises: determining initial super-resolution image data of an initial image, the initial super-resolution image data being image data after super-resolution processing is performed on the initial image in a channel direction; on the basis of the size of a target image, performing transformation processing on pixel coordinates of each pixel in the initial super-resolution image data to obtain target pixel coordinates of each pixel in the initial super-resolution image data; and generating target image data on the basis of target pixel coordinates of each pixel in the initial super-resolution image data, the target image data being image data of a super-resolution image corresponding to the initial image, and the image size of the super-resolution image being the size of the target image. The image processing efficiency is improved.
