TRANSACTION SUPPORT SYSTEM

ABSTRACT

Disclosed is a transaction support system that comprises a transaction information processing part configured to communicate with terminals of traders via the Internet, a generation rule storage part configured to store a correspondence between a data item of order data and a data item of delivery data in a transaction, and a transaction information storage part configured to store the order data and the delivery data. The transaction information processing part automatically generates delivery data based on the correspondence stored in the generation rule storage part from order data generated from a transaction between the traders, and stores the delivery data into the transaction information storage part.
