ABSTRACT

According to one embodiment, an electronic apparatus comprising an auxiliary storage includes a tray in which an auxiliary storage is fixed, a compartment that houses the tray inserted from the front of a rectangular opening in the front face of a housing, a pair of first movable plates horizontally rotatably provided at both rear corner ends of the compartment, and a connector attachment plate provided to a rear side face of the compartment. Both rear corner ends of the tray press respective first rotational faces of the pair of first movable plates, and a vibration impact absorption member attached to a second rotational face that rotates together with a first rotational face presses a side face of the tray.
