Abstract of the Disclosure

INTENNA CONNECTING APPARATUS

An intenna connecting apparatus for electrically connecting an intenna, which is inserted into a mobile communication terminal, to a printed circuit substrate installed below the intenna is provided. The intenna connecting apparatus includes a conductive plate electrically connected to circuit patterns of the printed circuit substrate, and a conductive medium installed on an upper surface of the conductive plate, the conductive medium including an elastic polymer material and a plurality of conductors contained in the elastic polymer material, wherein as the intenna is pressed down on the conductive medium, the conductive medium is compacted and the conductors come into contact with each other, and thus the antenna and the circuit patterns of the printed circuit substrate are electrically connected to each other.
