Abstract

HAND TOOL FOR MANIPULATING RETICLE PLATE

A tool (10) for grasping a rectangular plate (12), and having a handle (10) and a pair of spaced apart grip elements (24, 26) connected to the handle. A movable frame (32) is connected to the handle and moves relative to the handle. A second pair of spaced apart grip elements (44, 46) are connected to the movable frame, and are spring biased toward the first pair. A trigger (40) is connected to the frame near the handle, so that the second pair of grip elements may be moved toward and away from the first pair in response to movement of the trigger, to grasp and release a rectangular plate between the grip elements.
