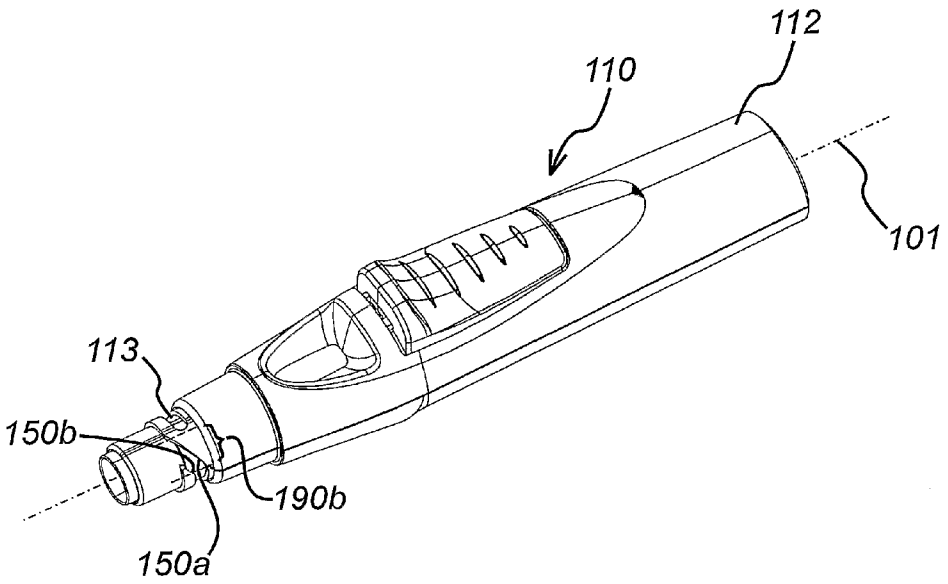
(54) **Title:** INJECTION DEVICE



(57) **Abstract:** An injection device (110) is described having a housing (112) and a housing closure means (130). The injection device (110) houses a syringe (114) having a needle (118) which is sealed by a boot (117). The housing closure means (130) is arranged so that the boot (117) can be connected to the housing closure means (130) simply, but cannot be removed from the housing closure means (130). The housing (112) and housing closure means (130) are arranged so that upon rotation of the housing closure means (130), the housing closure means (130) member first rotates relative to the housing and then moves away from the housing. The injection device is simple to use and manufacture.
