ABSTRACT

A CUFF LINK

A cuff link for use in coupling first and second sections (X,Y) of a sleeve together, said cuff link including a first arm (2) and a second arm (2'), wherein said first and second arms (2,2') are selectively adjustable between at least a relatively opened configuration in which at least one of the first and second arms (2,2') are able to be inserted through holes disposed in each of the first and second sections (X,Y) of the sleeve, and, a relatively closed configuration in which the first and second arms (2,2') are adapted to form a substantially closed loop which passes through the holes disposed in the first and second sections (X,Y) of the sleeve.
