ABSTRACT

Methods, apparatuses, devices, and storage media for creating a digital assistant. One of the methods includes receiving settings information for the digital assistant in a natural language from the user. This settings information is configured to generate prompt input for a model called by the digital assistant. The response of the digital assistant to the user is determined based on the output of the model. Further, the digital assistant is created based on the configuration information. In this way, users can easily, quickly, flexibly and freely create digital assistants.
