ABSTRACT

An offshore floating structure can move to an installation site, where the offshore floating structure is moored and fixed for operation. The mid part in the longitudinal direction of the offshore floating structure has an approximately rectangular parallelepiped shape. An upper deck 25 of an aft part 13 connected to the mid part is rectangular with an equivalent breadth to that of an upper deck of the mid part. A lower portion of the aft part 13, below the water line during transit, has a streamlined shape that is tapered toward the stern.
